Introduction

Hamiltonian formulation and surface terms

Asymptotic symmetries

Algebra of charges

Asymptotically anti-de Sitter spaces

Central charge in 3 dimensions

Chern-Simons reformulation

Conclusions

Three-dimensional gravity, with or without cosmological constant, is at first sight trivial.

Indeed, the Riemann tensor is completely determined by the Ricci tensor, and the Einstein equations imply therefore that the solutions are spaces of constant curvature,

$$R_{\lambda\mu\rho\sigma} = \Lambda \left(g_{\lambda\rho} g_{\mu\sigma} - g_{\lambda\sigma} g_{\mu\rho} \right)$$

(locally Minkowski, dS or AdS). There is no local degree of freedom.

Chern-Simons reformulation

Conclusions

Three-dimensional gravity, with or without cosmological constant, is at first sight trivial.

Indeed, the Riemann tensor is completely determined by the Ricci tensor, and the Einstein equations imply therefore that the solutions are spaces of constant curvature,

$$R_{\lambda\mu\rho\sigma} = \Lambda \left(g_{\lambda\rho} g_{\mu\sigma} - g_{\lambda\sigma} g_{\mu\rho} \right)$$

(locally Minkowski, dS or AdS). There is no local degree of freedom.

However, the case with negative cosmological constant has attracted in the last years a lot of interest.

Chern-Simons reformulation

Conclusions

This is because even though the theory is locally trivial, it is not globally so.

It admits black hole solutions which are obtained through identifications of anti-de-Sitter space.

It has an interesting behaviour at infinity, where the asymptotic symmetry algebra is given by two copies of the Virasoro algebra with central charge $c = \frac{3\ell}{2G}$.

Three-dimensional gravity with negative cosmological constant presents therefore many of the interesting features of the higher-dimensional versions, but in a much simpler context.

Defining conserved charges (energy, angular momentum, ...) in general relativity is a subtle issue.

One approach is based on the Hamiltonian formulation of gravity.

It has the advantage of clearly connecting the charges to the generators of the corresponding symmetries.

It can be applied to asymptotic symmetries that are not exact symmetries.

Finally, it gives direct access to the algebra of the charges and the possibility of non-Poissonian actions ("central charges")

Conclusions

Analysis of the condition $M[\xi] + \delta Q[\xi] = 0$

The surface term $M[\xi]$ picked up upon integration by parts can be worked out.

For instance, for pure gravity, it takes the universal form (independently of the boundary conditions and of the spacetime dimension),

$$M[\xi] = -\int d^{d}S_{n}G^{ijmn} \left(\xi^{\perp}\delta g_{ij|m} - \xi^{\perp}_{,m}\delta g_{ij}\right)$$
$$-\int d^{d}S_{n}2N_{m}\delta\pi^{mn}$$
$$-\int d^{d}S_{n}(2N^{k}\pi^{mn} - N^{n}\pi^{km})\delta g_{km}.$$

Conclusions

Determination of the surface term $Q[\xi]$

In general, the requirement $M[\xi] + \delta Q[\xi] = 0$ has no solution because $M[\xi]$ is not integrable (i.e., not the variation of a local surface term).

Hence one needs to restrict the allowed class of fields by boundary conditions.

Thus, even though the expression for $M[\xi]$ can be worked out without knowing the boundary conditions, verifying explicitly the existence of $Q[\xi]$ requires a specific form of the boundary conditions.

Asymptotic behaviour of gravity in three dimensions

Marc Henneaux

Introduction

Hamiltonian formulation and surface terms

Asymptotic symmetries

Algebra of charges

Asymptotically anti-de Sitter spaces

Central charge in 3 dimensions

Chern-Simons reformulation

Conclusions

If ξ and η are asymptotic symmetries, then their commutator $[\xi, \eta]$ also is. Furthermore, one has the following useful theorem (Brown-Henneaux JMP 1986)

Theorem :

- $[H[\xi], H[\eta]]$ and $H[[\xi, \eta]]$ generate the same asymptotic transformation
- i.e., [F, [H[ξ], H[η]]] = [F, H[[ξ,η]]] for any functional F of the dynamical variables.

Hence $[H[\xi], H[\eta]]$ and $H[[\xi, \eta]]$ differ, up to trivial terms, by a *c*-number $K[\xi, \eta]$ (which fulfills cocycle condition etc...).

Introduction

Hamiltonian formulation and surface terms

Asymptotic symmetries

Algebra of charges

Asymptotically anti-de Sitter spaces

Central charge in 3 dimensions

Chern-Simons reformulation

Conclusions

The AdS metric reads

with $\Omega = r$ and

$$ds^2 = \Omega^2 d\sigma^2$$

 $d\sigma^2 = -dt^2 + d\omega^2 + d\rho^2.$

The boundary at $\rho = 1$ is a timelike surface with topology $\mathbb{R} \times S^{d-1}$. AdS isometries are conformal transformations of the boundary - and all of them for $D \ge 4$.

< □ > < 同 > < 回 > < 回 > .

Asymptotic behaviour of gravity in three dimensions

Marc Henneaux

Introduction

Hamiltonian formulation and surface terms

Asymptotic symmetries

Algebra of charges

Asymptotically anti-de Sitter spaces

Central charge in 3 dimensions

Chern-Simons reformulation

Conclusions

The AdS metric reads

with
$$\Omega = r$$
 and

$$d\sigma^2 = -dt^2 + d\omega^2 + d\rho^2.$$

 $ds^2 = \Omega^2 d\sigma^2$

The boundary at $\rho = 1$ is a timelike surface with topology $\mathbb{R} \times S^{d-1}$. AdS isometries are conformal transformations of the boundary - and all of them for $D \ge 4$.

For D = 3, the boundary is the cylinder $\mathbb{R} \times S^1$ with metric $-dt^2 + d\phi^2$ and the conformal group at infinity is infinite-dimensional and contains O(2, 2), which is a proper finite-dimensional subgroup.

Boundary of anti-de Sitter space

Asymptotic behaviour of gravity in three dimensions

Marc Henneaux

Introduction

Hamiltonian formulation and surface terms

Asymptotic symmetries

Algebra of charges

Asymptotically anti-de Sitter spaces

Central charge in 3 dimensions

Chern-Simons reformulation

Conclusions

The situation is thus the following :

	Background isometries	Conformal group at infinity
$D \ge 4$	<i>O</i> (<i>D</i> -1,2)	O(D-1,2)
D=3	O(2,2)	$\mathcal{C}^{(2)} \supset O(2,2)$

One thus expects that the AdS group O(D-1,2) is the asymptotic symmetry group in $D \ge 4$ dimensions and that the infinite-dimensional conformal group $\mathscr{C}^{(2)}$ is the asymptotic symmetry group in D = 3. In that latter case, central charges are allowed and do, in fact, occur.

A (1) > A (2) > A (2) > A

Boundary of anti-de Sitter space

Asymptotic behaviour of gravity in three dimensions

Marc Henneaux

Introduction

Hamiltonian formulation and surface terms

Asymptotic symmetries

Algebra of charges

Asymptotically anti-de Sitter spaces

Central charge in 3 dimensions

Chern-Simons reformulation

Conclusions

The situation is thus the following :

	Background isometries	Conformal group at infinity
$D \ge 4$	<i>O</i> (<i>D</i> -1,2)	O(D-1,2)
D=3	<i>O</i> (2,2)	$\mathcal{C}^{(2)} \supset O(2,2)$

One thus expects that the AdS group O(D-1,2) is the asymptotic symmetry group in $D \ge 4$ dimensions and that the infinite-dimensional conformal group $\mathscr{C}^{(2)}$ is the asymptotic symmetry group in D = 3. In that latter case, central charges are allowed and do, in fact, occur.

The question is to explicitly give the precise boundary conditions that implement these general ideas.

one allows (in the first case) deviations $\Delta g_{\alpha\beta}$ from AdS that behave as

 $\Delta g_{rr} = \frac{f_{rr}}{r^4} + O(r^{-5}), \quad \Delta g_{rm} = \frac{f_{rm}}{r^3} + O(r^{-4}),$ $\Delta g_{mn} = f_{mn} + O(r^{-1}),$ with m = +, - and $f_{\alpha\beta}(x^m).$

Chern-Simons reformulation

Conclusions

- AdS gravity can be reformulated as an $sl(2, R) \oplus sl(2, R)$ Chern-Simons theory.
- The action reads

 $S[A, \tilde{A}] = S_{CS}[A] - S_{CS}[\tilde{A}]$

where A, \tilde{A} are connections taking values in the algebra sl(2, R),
