eROSITA Data Rights

Independent set of science working groups with some coordination expected

eROSITA-D: external collaboration proposals welcomed

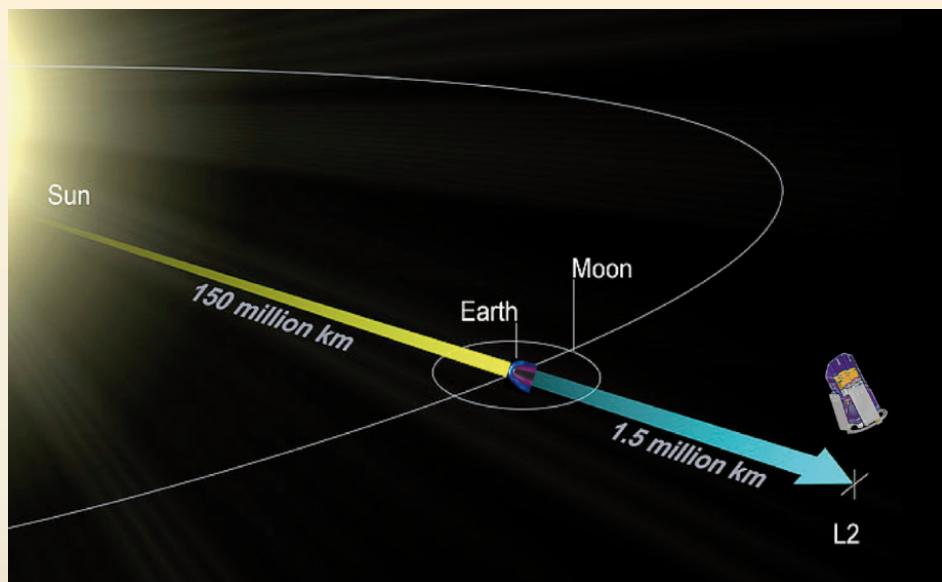

eROSITA Science WG Contacts

- Principle Investigator
 - Peter Predehl predehl@mpe.mpg.de
- Project Scientist
 - Andrea Merloni am@mpe.mpg.de
- Cluster WG Coordinators
 - Alexis Finoguenov alexis@mpe.mpg.de
 - Thomas Reiprich reiprich@astro.uni-bonn.de
 - Joe Mohr Joseph.Mohr@physik.lmu.de
- AGN WG Coordinators
 - Paul Nandra knandra@mpe.mpg.de
 - Antonis Georgakis age@mpe.mpg.de
 - Mara Salvato mara@mpe.mpg.de

SRG Mission

Launch from Baikonur with Zenit-Fregat – March 2017

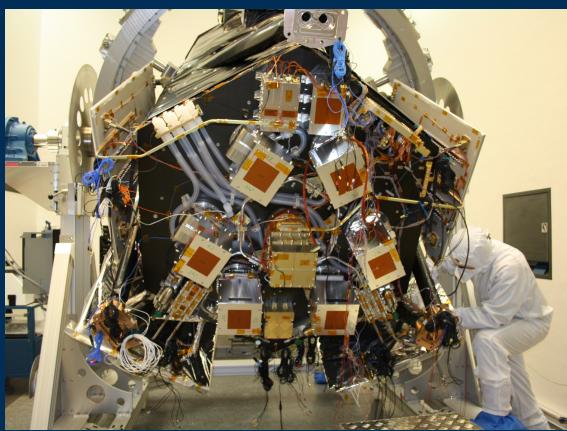

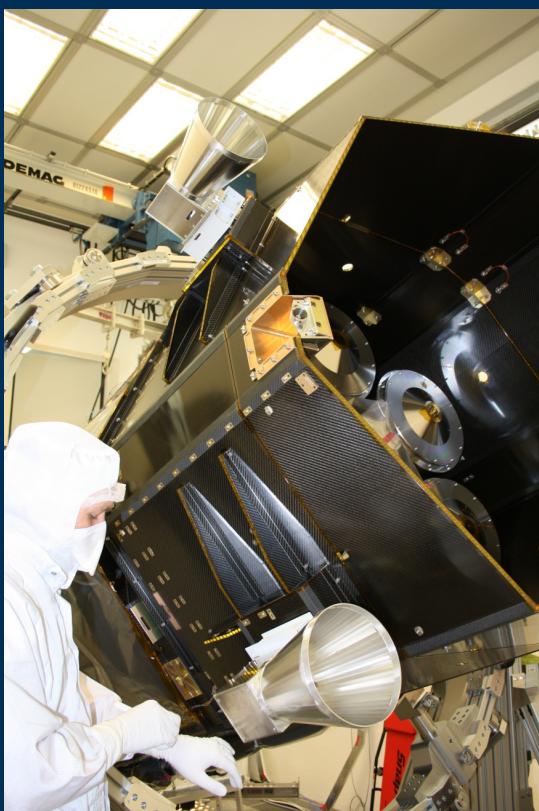

- 3 months: flight to L2, checkout, verification and calibration phase
- 4 years: 8 all sky surveys (scanning mode: 6 rotations/day, 1 degree advance per day)
- 3 years: pointed observation phase, including ~20% GTO. 1 AO per year

TR33 - eROSITA - Mohr

14

e-ROSITA All Sky X-ray Survey

- Good angular resolution –
 - ~16" on axis, 28" averaged over field (survey mode)
(similar to ROSAT PSPC pointed data within inner ring)
- Characteristic flux limit is $\sim 2 \times 10^{-14}$ erg/s/cm²
(~30X deeper than ROSAT All Sky Survey w/ CCD spectroscopy)

18. Sept '15

TR33 - eROSITA - Mohr

15

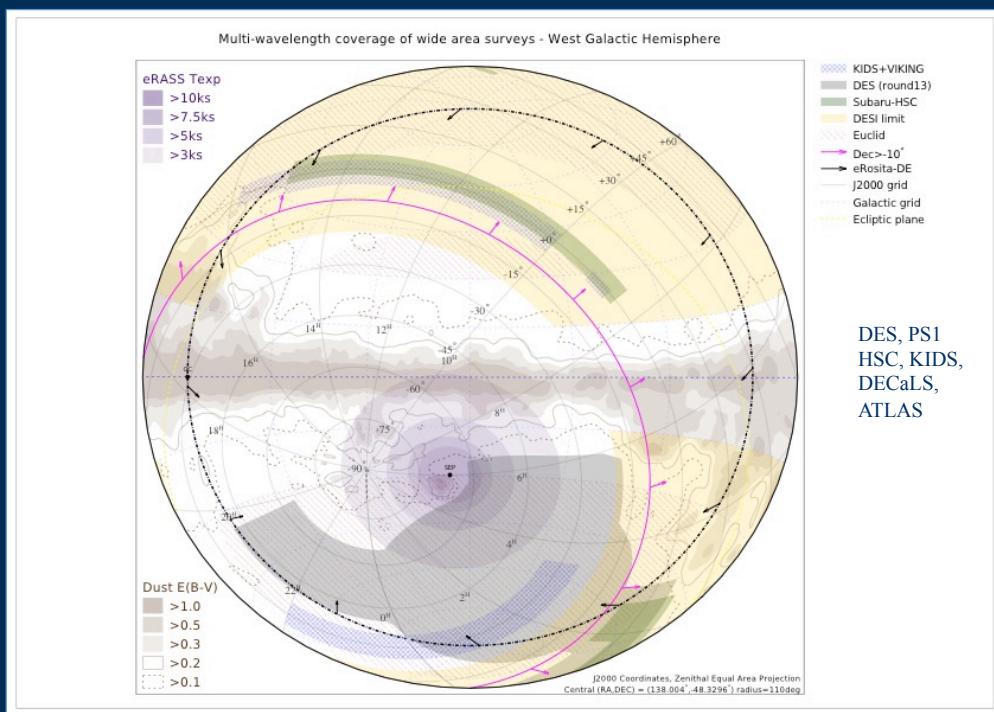

$\sim 10^5$ X-ray selected galaxy clusters

Optical Surveys Enable:

- * Cluster confirmation
- * Cluster photo-z's
- * Weak lensing mass constraints

16

Cluster Samples

- X-ray: $\sim 10^{2-3}$
 - RASS, XXL, XMM-BCS
- SZE: $\sim 10^{2-3}$
 - SPT-SZ, Planck, ACT
- Optical: $\sim 10^{3-4} (10^5)$
 - RCS, SDSS (DES, Euclid, LSST)
- eROSITA: $\sim 50,000$

18. Sept '15

17

Cluster Surveys - Cosmological Leverage

Cluster Redshift Distribution
Sensitive to volume-redshift relation
and cluster abundance evolution

$$\frac{dN(z)}{dz d\Omega} = \frac{dV}{dz d\Omega}(z) n(z)$$

Dark Energy: see Haiman, Mohr, Holder 2001

Cluster Abundance Evolution

Depends on the power spectrum of density fluctuations and growth rate of cosmic structure

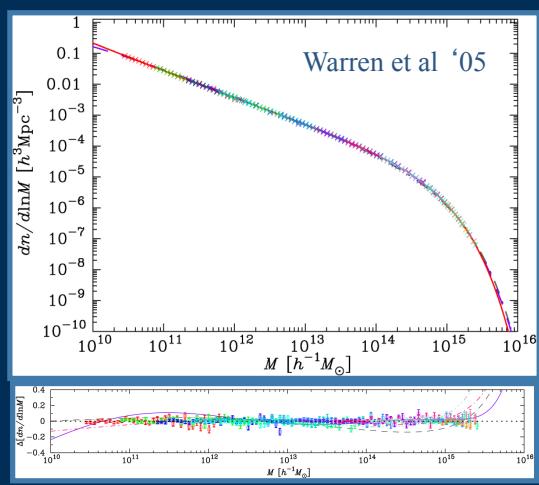

Can be studied directly in numerical simulations; simple “cosmology independent” fitting formulae exist

Bottom line: surveys constrain

Distances

Characteristics and growth rate of density perturbations

But you must know the mass selection of your survey!

18

Results: 400 deg² ROSAT Archival Sample

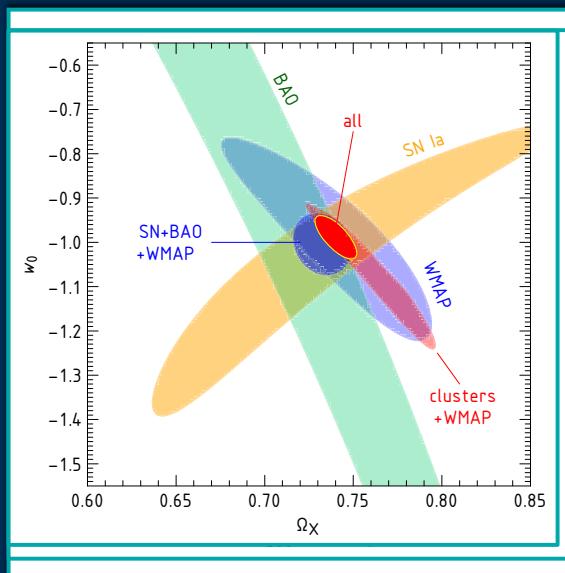

Vikhlinin et al 2009

- Analysis:

- 49 “local” + 37 $z > 0.35$ clusters
- Mass functions
- 12 clusters at $z > 0.55$ require DE
- Independent constraints in good agreement with WMAP+cosmology
- w constrained to 0.2(clus)/0.05(all)

Used hydrostatic mass estimates from X-ray

18. Sept '15

TR33 - eROSITA - Mohr

19

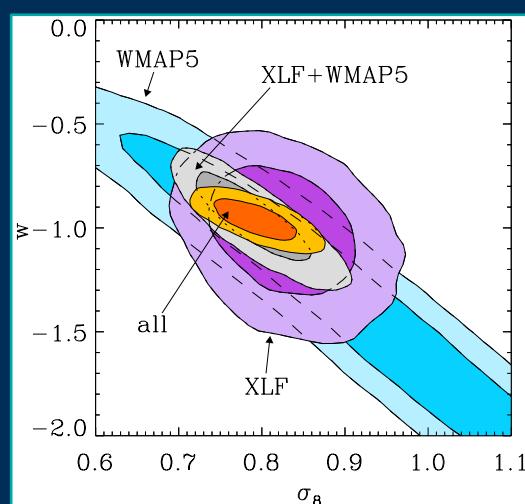

Results: ROSAT All Sky Survey

Mantz et al 2010

- Analysis:
 - Mass function of ~250 clusters
 - Constant f_{ICM} from 42 “relaxed” systems
 - Mass-obs relation normalization freedom allowed and constrained using 6 low z clusters
- Independent constraints
 - $\sigma_8 = 0.82 (0.05)$
 - $w = -1.01 (0.20)$
- Combined constraints
 - WMAP+SNe+BAO+Clusters+ f_{ICM} :
 - $\sigma_8 = 0.79 (0.03)$
 - $w = -0.96 (0.06)$

Used hydrostatic mass estimates from X-ray

20

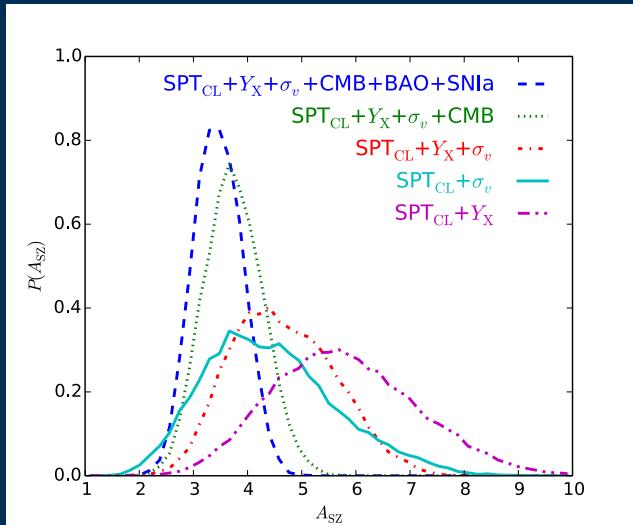

Progress: Cluster Mass Calibration

Bocquet et al 2015

SZE-Mass Rel'n:

$$\xi = A_{\text{SZ}} \left(\frac{M_{500}}{3 \times 10^{14} h^{-1} M_{\odot}} \right)^{B_{\text{SZ}}} \left(\frac{E(z)}{E(0.6)} \right)^{C_{\text{SZ}}}$$

- Mass calibration must be carried out simultaneously with cosmo analysis
- Selection effects must be accounted for (Eddington bias)
- External cosmo constraints act as mass info
- Cluster masses:
 - increase by 21% from X-ray only (purple) to dispersion only (cyan)
 - 25% increase when adding CMB data (green) and additional distance measurements (blue)

Weak lensing mass calibration underway: Applegate, Dietrich, Schrabback, Hoekstra et al
18. Sept '15 TR33 - eROSITA - Mohr

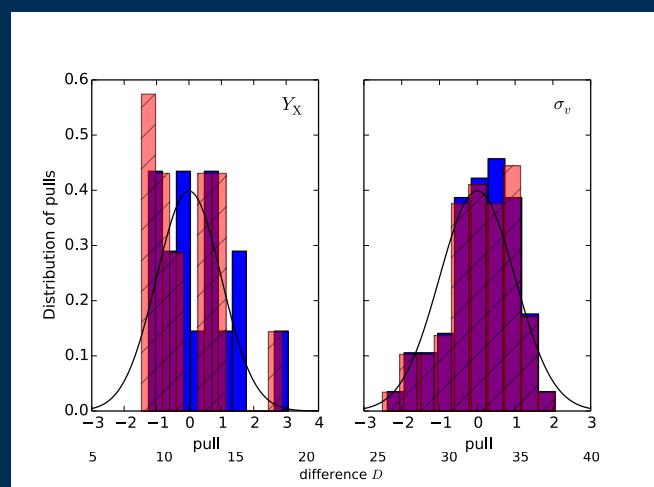

21

Progress: Consistency Tests

- We probe for consistency between the cluster dataset and the best fit cosmology
- Massfunc(ξ, z) and mass calibration show no significant evidence of tension

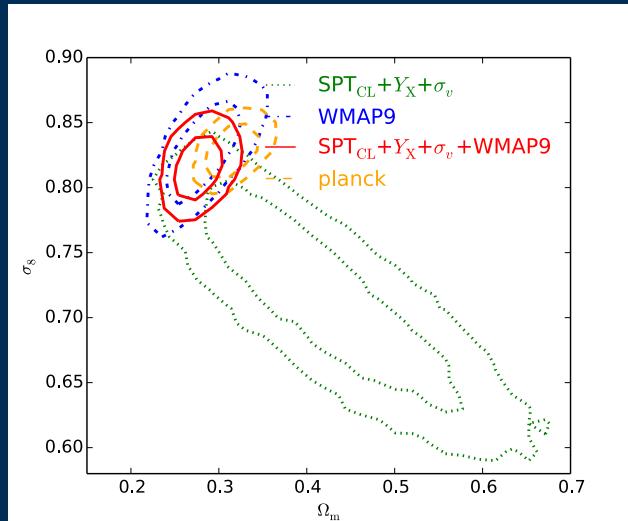

Bocquet+15

Results: SPT Cluster Cosmology

Bocquet et al 2015

- 94 SPT clusters (720 deg^2)
- Mass calibration
 - 16 X-ray Y_x s
 - 65 velocity dispersions
- PMC algorithm
- 19 parameters
 - 6 cosmological
 - 4 SZ
 - 4 X-ray Y_x
 - 5 velocity dispersion
- Mild tension $\sim 1.1\sigma - 1.5\sigma$

$$\sigma_8 = 0.829 \pm 0.011 \quad w = -0.995 \pm 0.063 \quad \Sigma m_v = (0.148 \pm 0.081) \text{ eV} \quad \gamma = 0.73 \pm 0.28$$

18. Sept '15

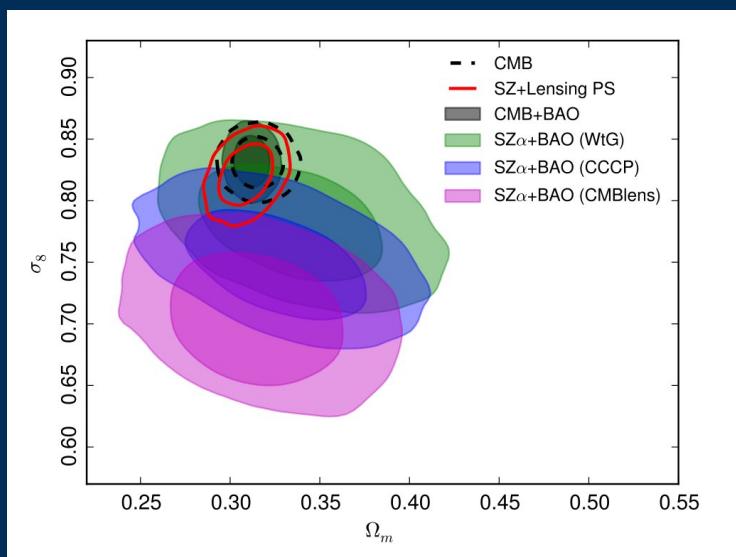

TR33 - eROSITA - Mohr

23

Results: Planck Cluster Cosmology

Planck Collaboration XXIV (2015)

- 439 clusters
- No strong tension with CMB if WL calibrations used
- CMB lensing implies no hydrostatic mass bias, in conflict with simulations

Represents major improvement upon original 2012 cluster cosmology analysis

18. Sept '15

TR33 - eROSITA - Mohr

24

Summary

- eROSITA will open new window on the hot Universe
 - Launch in March 2017
 - Eight all sky X-ray surveys over 4 years
 - ~30x deeper than RASS w/ 0.5' PSF and CCD detectors
- Cluster cosmology continues to mature
 - ROSAT samples independently analyzed
 - Cosmology consistent with other probes
 - SZE samples have emerged
 - Cosmology consistent with other probes- better mass calibration == stronger tests
 - SPT has pushed cluster cosmology frontier to $z \sim 1.5$
 - Algorithms for self-consistent mass calibration improved
 - Systematic WL studies providing first constraints- will continue
 - Theoretical mass function studies continue
 - There is clear path toward analysis of 10^{4-5} eROSITA clusters

18. Sept '15

TR33 - eROSITA - Mohr

25

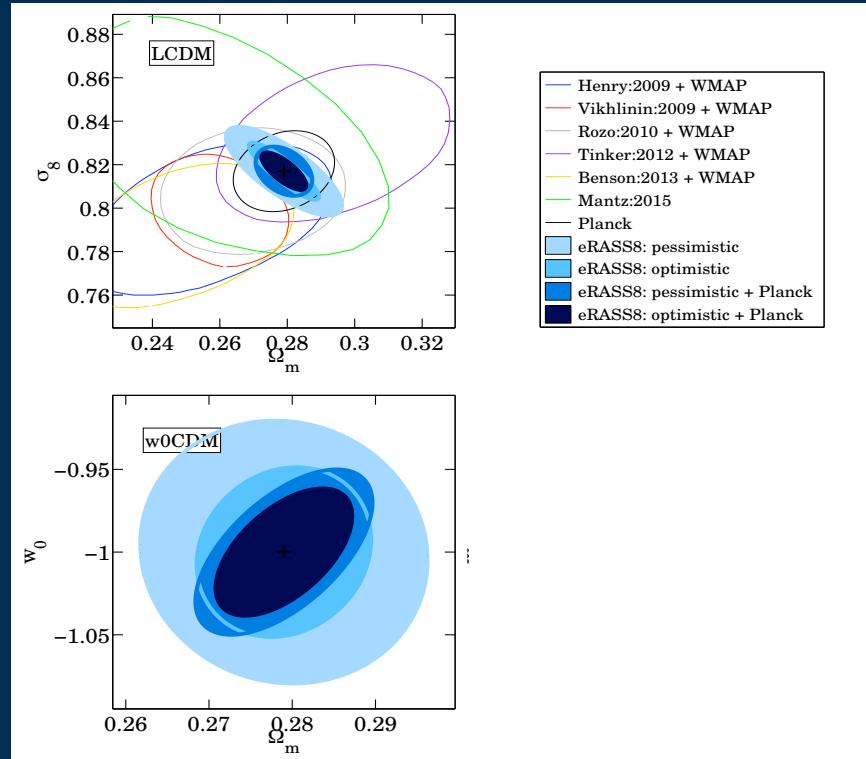

Cosmological constraint Forecasts

Pillepich et al 2015

Pessimistic:
+ photo- z
+ no groups
+ $L_X - M$ priors from
Vikhlinin (2009)

Optimistic:
+ spectro- z
+ adding groups
+ 4 times tighter
 $L_X - M$ priors

26

Results: Growth Rate of Structure

- One can carry out a consistency test of General Relativity by allowing the growth rate of structure to deviate from the GR expectation

$$\frac{d \ln \delta}{d \ln a} = \Omega_m^\gamma(a)$$

Following Rapetti et al 2010
