# Overview

#### 1 Introduction

- 2 Weyl-Fefferman-Graham gauge
- **3** Intermezzo: What is a Weyl Connection?
- 4 Back to Holography: Weyl Anomaly

#### 5 Outlook

# Introduction I

AdS holography is geometrically built using the Fefferman-Graham gauge [Fefferman, Graham '85-...]

mathematically rigorous

ont Weyl covariant

The boundary couples to a conformal class of metrics: Weyl needed Weyl pillar in other formulation of holography, like fluid/gravity

[Loganayagam et al '08-..., LC, Petkou, Petropoulos, Siampos '17-'18]

# Introduction II

Our enhancement: Weyl-Fefferman-Graham gauge

- Weyl diffeomorphisms are linearly implemented
- New bulk Weyl gauge field
- Appearance of a Weyl connection in the boundary
- Holographic anomaly couples to Weyl covariant curvatures tensors
- Rich boundary structure to explore

◆□▶ ◆□▶ ◆三▶ ◆三▶ ○○ ○○

#### Weyl-Fefferman-Graham gauge I

Fefferman-Graham in Poincaré coordinates with boundary  $z \rightarrow 0$ :[FG '85]

$$\mathrm{d}s^2 = L^2 \frac{\mathrm{d}z^2}{z^2} + h_{\mu\nu}(x,z)\mathrm{d}x^{\mu}\mathrm{d}x^{\nu}$$

near the boundary it can be expanded (d = boundary dimension)

[Skenderis '02]

$$h_{\mu\nu} = \frac{L^2}{z^2} \left[ \gamma^{(0)}_{\mu\nu}(x) + \frac{z^2}{L^2} \gamma^{(2)}_{\mu\nu}(x) + \dots \right] + \frac{z^{d-2}}{L^{d-2}} \left[ \pi^{(0)}_{\mu\nu}(x) + \frac{z^2}{L^2} \pi^{(2)}_{\mu\nu}(x) + \dots \right]$$

 $\gamma_{\mu\nu}^{(0)}$  boundary metric,  $\pi_{\mu\nu}^{(0)}$  boundary energy-momentum tensor. The boundary is located at

$$\frac{z^2}{L^2} \mathrm{d}s^2 \xrightarrow[z \to 0]{} \gamma^{(0)}_{\mu\nu}(x) \mathrm{d}x^{\mu} \mathrm{d}x^{\nu} = \mathrm{d}s^2_{bdy}$$

defined up to a Weyl transformation  $\Rightarrow$  conformal boundary.

#### Weyl-Fefferman-Graham gauge II

Def: bulk Weyl diffeomorphism

$$z \mapsto z' = z/\mathcal{B}(x) \qquad x^{\mu} \mapsto x'^{\mu} = x^{\mu}$$

It induces a Weyl rescaling of the boundary

$$\gamma^{(0)}_{\mu\nu} \mapsto \frac{\gamma^{(0)}_{\mu\nu}}{\mathcal{B}(x)^2}$$

# Weyl-Fefferman-Graham gauge II

Def: bulk Weyl diffeomorphism

$$z \mapsto z' = z/\mathcal{B}(x) \qquad x^{\mu} \mapsto x'^{\mu} = x^{\mu}$$

It induces a Weyl rescaling of the boundary

$$\gamma_{\mu\nu}^{(0)} \mapsto \frac{\gamma_{\mu\nu}^{(0)}}{\mathcal{B}(x)^2}$$

Fefferman-Graham is sensitive to this diffeomorphism

$$\mathrm{d}s^2 = L^2 \left(\frac{\mathrm{d}z'}{z'} + \partial_\mu \ln \mathcal{B}(x) \,\mathrm{d}x^\mu\right)^2 + h_{\mu\nu}(x, z'\mathcal{B}(x))\mathrm{d}x^\mu\mathrm{d}x^\nu$$

# Weyl-Fefferman-Graham gauge III

Two ways out

• Usual one: redefine x in subleading orders  $x' = x + f(x)z^2 + \dots$ Problem: blurs Weyl covariance of subleading tensors (well-known)

```
[Mazur, Mottola '01,...]
```

Our story: enhance the Fefferman-Graham gauge to the Weyl-Fefferman-Graham one, where Weyl diffs are allowed.

<ロト (四) (三) (三) (三) (三)

# Weyl-Fefferman-Graham gauge III

Two ways out

• Usual one: redefine x in subleading orders  $x' = x + f(x)z^2 + \dots$ Problem: blurs Weyl covariance of subleading tensors (well-known)

```
[Mazur, Mottola '01,...]
```

Our story: enhance the Fefferman-Graham gauge to the Weyl-Fefferman-Graham one, where Weyl diffs are allowed.

$$\mathrm{d}s^2 = L^2 \left(\frac{\mathrm{d}z}{z} - a_\mu(x, z)\mathrm{d}x^\mu\right)^2 + h_{\mu\nu}(x, z)\mathrm{d}x^\mu\mathrm{d}x^\nu$$

Novelty of this gauge: Weyl gauge field one form  $a_{\mu}$ , with expansion near the conformal boundary

$$a_{\mu}(z,x) = \left[a_{\mu}^{(0)}(x) + \frac{z^2}{L^2}a_{\mu}^{(2)}(x) + \dots\right] + \frac{z^{d-2}}{L^{d-2}}\left[p_{\mu}^{(0)}(x) + \frac{z^2}{L^2}p_{\mu}^{(2)}(x) + \dots\right]$$

 $a_{\mu}^{(0)}$  boundary Weyl source,  $p_{\mu}^{(0)}$  boundary Weyl current.

# Weyl-Fefferman-Graham gauge IV

Weyl diffeomorphism on the Weyl-Fefferman-Graham gauge

$$\gamma_{\mu\nu}^{(k)}(x) \mapsto \gamma_{\mu\nu}^{(k)}(x)\mathcal{B}(x)^{k-2}, \ \pi_{\mu\nu}^{(k)}(x) \mapsto \pi_{\mu\nu}^{(k)}(x)\mathcal{B}(x)^{d-2+k}$$

 $a_{\mu}^{(k)}(x) \mapsto a_{\mu}^{(k)}(x)\mathcal{B}(x)^{k} - \delta_{k,0}\partial_{\mu}\ln\mathcal{B}(x), \ p_{\mu}^{(k)}(x) \mapsto p_{\mu}^{(k)}(x)\mathcal{B}(x)^{d-2+k}$ 

Weyl covariant subleading tensors! Define the non-coordinatized basis

$$\{e = L\left(\frac{\mathrm{d}z}{z} - a_{\mu}(x, z)\mathrm{d}x^{\mu}\right), \mathrm{d}x^{\mu}\} \Rightarrow g = e \otimes e + h_{\mu\nu}\mathrm{d}x^{\mu} \otimes \mathrm{d}x^{\nu}$$

Dual vectors  $\{\underline{e} = \frac{z}{L}\partial_z, \underline{D}_{\mu} = \partial_{\mu} + a_{\mu}(x, z)z\partial_z\}$ The bulk LC connection in this frame is given by

$$\nabla_{\underline{D}_{\mu}}\underline{D}_{\nu} = \Gamma^{\lambda}_{\mu\nu}\underline{D}_{\lambda} + \Gamma_{\mu\nu}\underline{e}$$

#### Intermezzo: What is a Weyl Connection?

Levi-Civita connection  $\nabla$  is the unique connection satisfying

i) metricity:  $\nabla g = 0$ , ii) torsionless:  $T(\underline{X}, \underline{Y}) = 0$ 

Tensorial expressions  $\Rightarrow$  its curvatures are tensors

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへで

Levi-Civita connection  $\nabla$  is the unique connection satisfying

i) metricity:  $\nabla g = 0$ , ii) torsionless:  $T(\underline{X}, \underline{Y}) = 0$ 

Tensorial expressions  $\Rightarrow$  its curvatures are tensors

Weyl transformation  $g \to \Omega^{-2}g$ . Not a diffeomorphism i) is not Weyl invariant. Usually: require the  $\Gamma$ s to shift under Weyl. Problem: curvatures not Weyl tensors  $\Rightarrow$  Promote to Weyl metricity

i\*) Weyl metricity: 
$$\nabla g - 2a \otimes g = 0$$

With a a one form, shifting non-linearly under Weyl  $a \rightarrow a - d \ln \Omega$ Theorem:  $\nabla$  satisfying i\*) and ii) is the unique Weyl connection [Folland '70, Hall '92]

Curvature tensors Weyl covariant, impo for holography

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ つ へ ()

# Back to Holography: Weyl Anomaly I

Weyl anomaly obtained comparing bulk partition functions in different coordinates (Weyl diffeomorphism) to its boundary dual

$$\frac{Z_{bulk}\left[g', z', x'; \gamma'_{(0)}\right]}{Z_{bulk}\left[g, z, x; \gamma_{(0)}\right]} = 1 \qquad \frac{Z_{bdy}[x; \gamma'_{(0)}, a'_{(0)}, \ldots]}{Z_{bdy}[x; \gamma_{(0)}, a_{(0)}, \ldots]} \stackrel{?}{=} 1$$

In even boundary dimension d = 2k, an anomaly  $\mathcal{A}_k$  arises

$$0 = S_{bulk}[g'; \gamma'_{(0)}, ... | z', x] - S_{bulk}[g; \gamma_{(0)}, ... | z, x]$$
  
=  $S_{bdy}[x; \gamma'_{(0)}, a'_{(0)}, ...] - S_{bdy}[x; \gamma_{(0)}, a_{(0)}, ...] + \mathcal{A}_k$ 

Difference of bulk actions in Weyl-diffs-related coordinate systems = difference of boundary actions in Weyl-related backgrounds,

up to an anomalous term

[Henningson, Skenderis '98]

September 13, 2019 11 / 16

Back to Holography: Weyl Anomaly II

$$S_{bulk}[g;\gamma_{(0)},...|z,x] = \frac{1}{16\pi G} \int_M e \wedge \mathrm{d}^d x \sqrt{-\det h} (R-2\Lambda)$$

On shell, it evaluates to

$$S_{bulk} = -\frac{d}{8\pi GL} \int_M \frac{\mathrm{d}z}{z} \wedge \mathrm{d}^d x \sqrt{-\det h}$$

Expand  $\sqrt{-\det h}$ , defining  $X^{(1)} = \gamma^{\mu\nu}_{(0)} \gamma^{(2)}_{\mu\nu}$ 

$$\sqrt{-\det h(z,x)} = \left(\frac{L}{z}\right)^d \sqrt{-\det \gamma^{(0)}} \left[1 + \frac{1}{2}\frac{z^2}{L^2}X^{(1)} + \dots\right]$$

Go to d = 2 and evaluate the difference of bulk Weyl-related actions:

$$\mathcal{A}_1 = \frac{1}{8\pi GL} \int_{\Sigma} \ln \mathcal{B} X^{(1)} \sqrt{-\det \gamma^{(0)}} \, \mathrm{d}^d x$$

Luca Ciambelli

September 13, 2019 12 / 16

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三回 のへ⊙

The resolution of Einstein equations gives

$$X^{(1)} = -\frac{L^2}{2(d-1)}R^{(0)}$$

where  $R^{(0)}$  is the Weyl Ricci scalar of  $\gamma^{(0)}$ , weight-2 Weyl covariant

Therefore

$$\mathcal{A}_1 = -\frac{L}{16\pi G} \int_{\Sigma} \ln \mathcal{B} \ R^{(0)} \sqrt{-\det \gamma^{(0)}} \ \mathrm{d}^d x$$

Luca Ciambelli

September 13, 2019 13 / 16

# Back to Holography: Weyl Anomaly IV

Comments

- It leads to the correct central charge  $c = \frac{3L}{2G}$  [Brown, Henneaux '85]
- However, not the usual LC Ricci but its Weyl covariant version
- Weyl covariance has to be a feature of  $\mathcal{A}_k$ ,  $\forall k$ , by construction

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへ⊙

# Back to Holography: Weyl Anomaly IV

#### Comments

- It leads to the correct central charge  $c = \frac{3L}{2G}$  [Brown, Henneaux '85]
- However, not the usual LC Ricci but its Weyl covariant version
- Weyl covariance has to be a feature of  $\mathcal{A}_k$ ,  $\forall k$ , by construction

The Weyl anomaly can be expressed cohomologically [Mazur, Mottola '01]

- The bulk on-shell action is proportional to the total (divergent) volume  $e \wedge vol_S$ , with  $vols_S = \sqrt{-\det h} d^d x$
- Is a top form so it is closed
- Weyl anomaly: two Weyl-related volumes differ by a top form

$$(e \wedge Tr(\gamma^{(2)})Vol_S)' - (e \wedge Tr(\gamma^{(2)})Vol_S) = -\frac{L}{16\pi G} d(\ln \mathcal{B} R^{(0)} Vol_S)$$

September 13, 2019

14 / 16

Luca Ciambelli

The Weyl-Fefferman-Graham gauge has led to a rich holographic structure. It would be worth to:

- Pursue the computation to higher dimensions
- Weyl boundary field theory, Ward identities and properties
- Non-Einsteinian modifications of gravity
- Holography with a non involutive boundary
