

COSMOLOGICAL CONSTRAINTS ON NEUTRINO PHYSICS

Workshop on Connecting Insights
in Fundamental Physics:
Standard Model and Beyond
Corfu, 4 September 2019

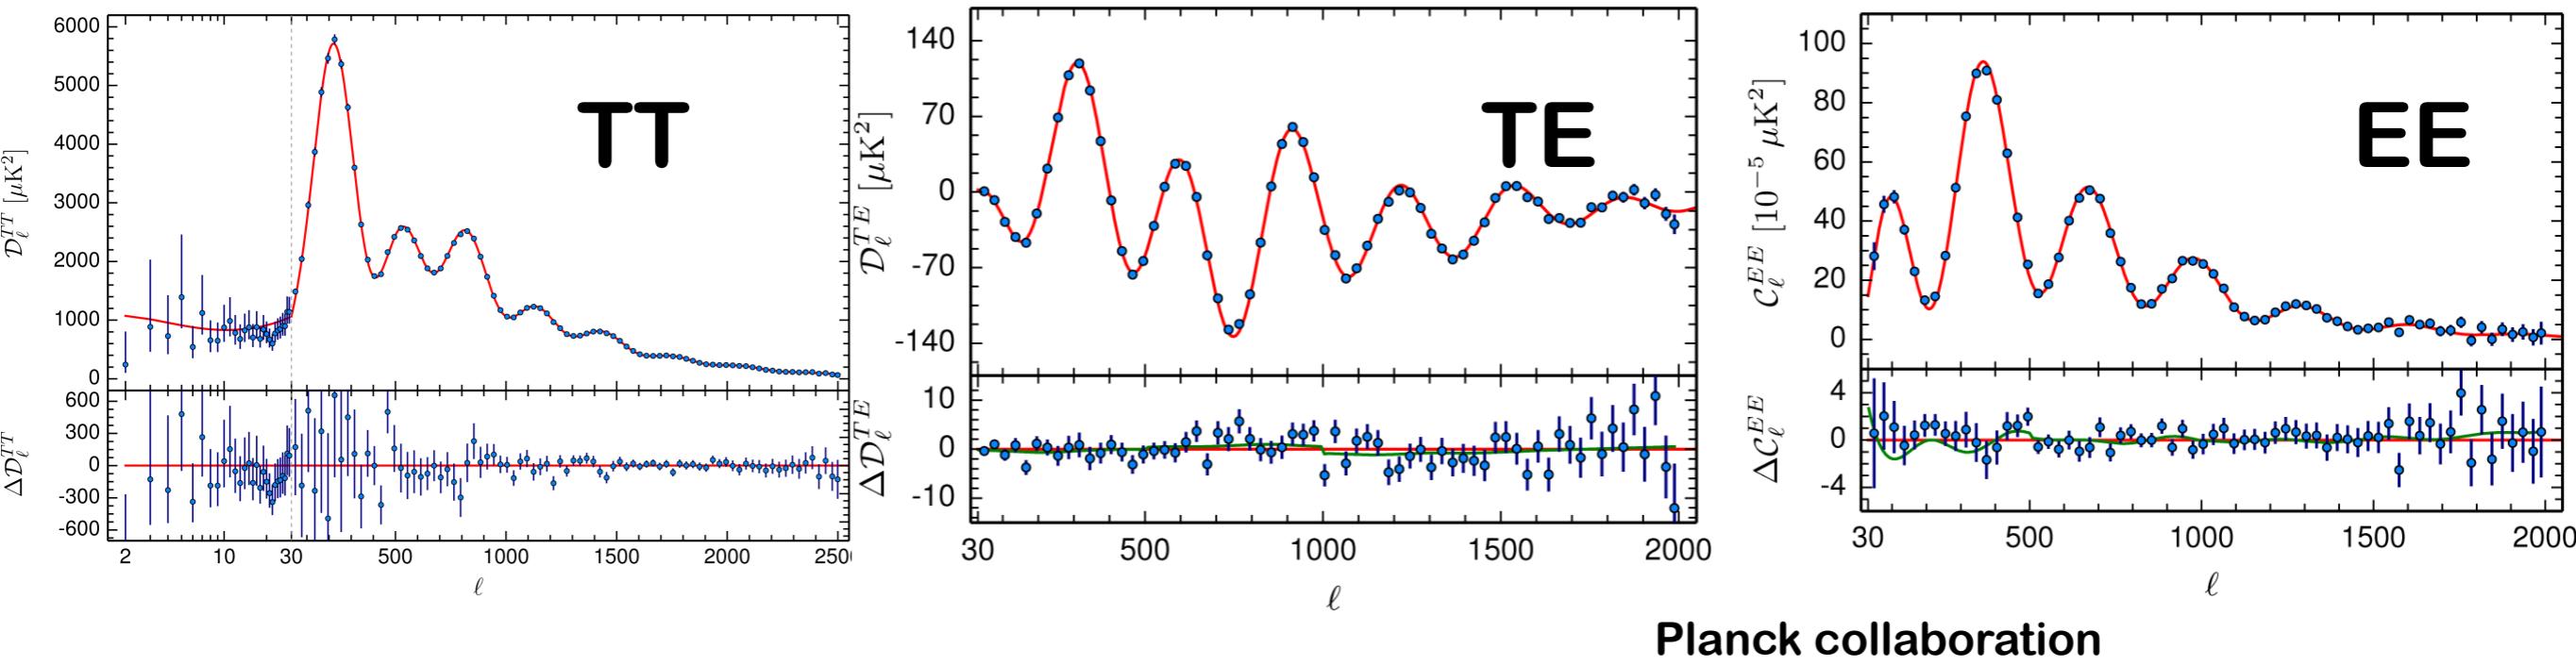

Martina Gerbino
Argonne National Laboratory

Results from Planck Coll., SO Coll., S4 Coll.,
and work in collaboration with Katie Freese, Elena Giusarma, Shirley Ho,
Massimiliano Lattanzi, Olga Mena, Sunny Vagnozzi

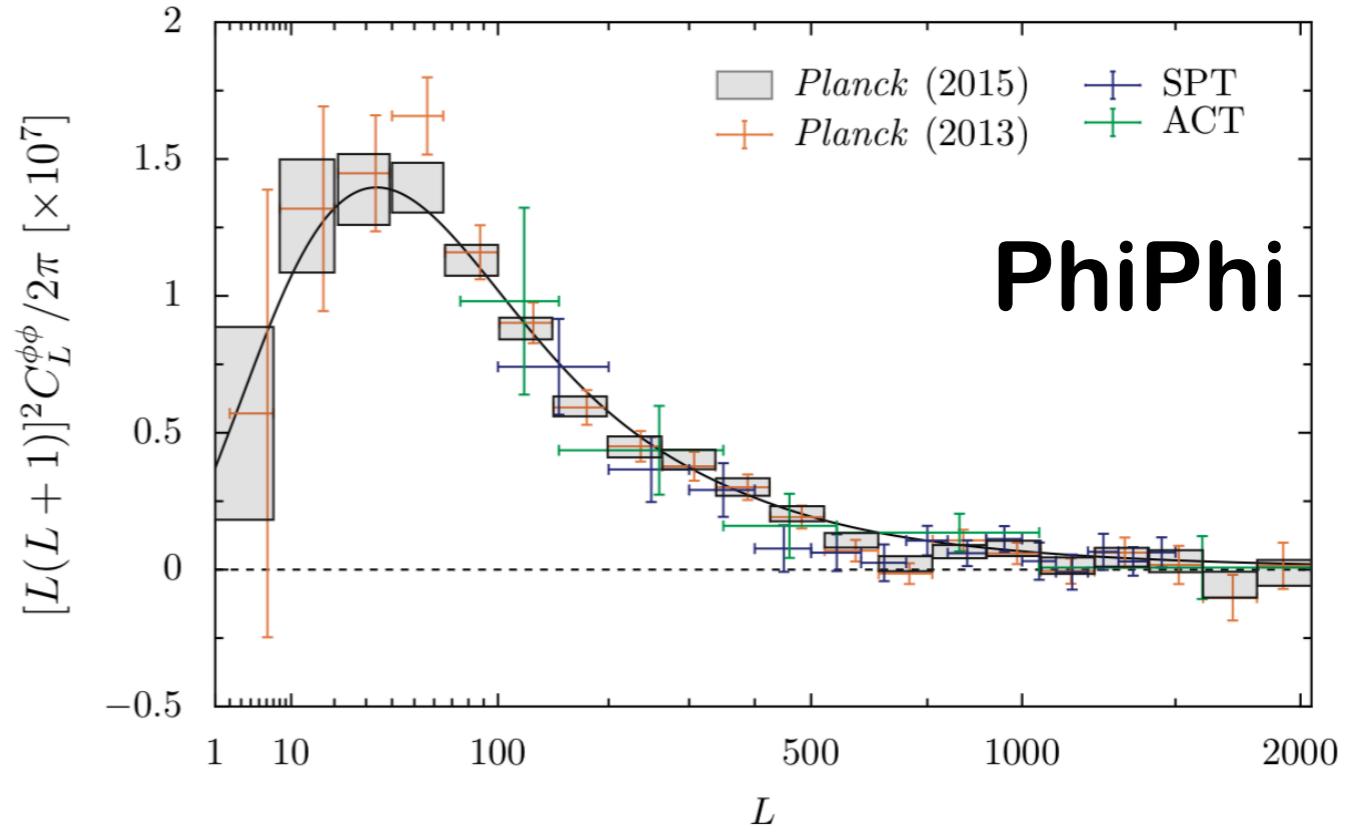

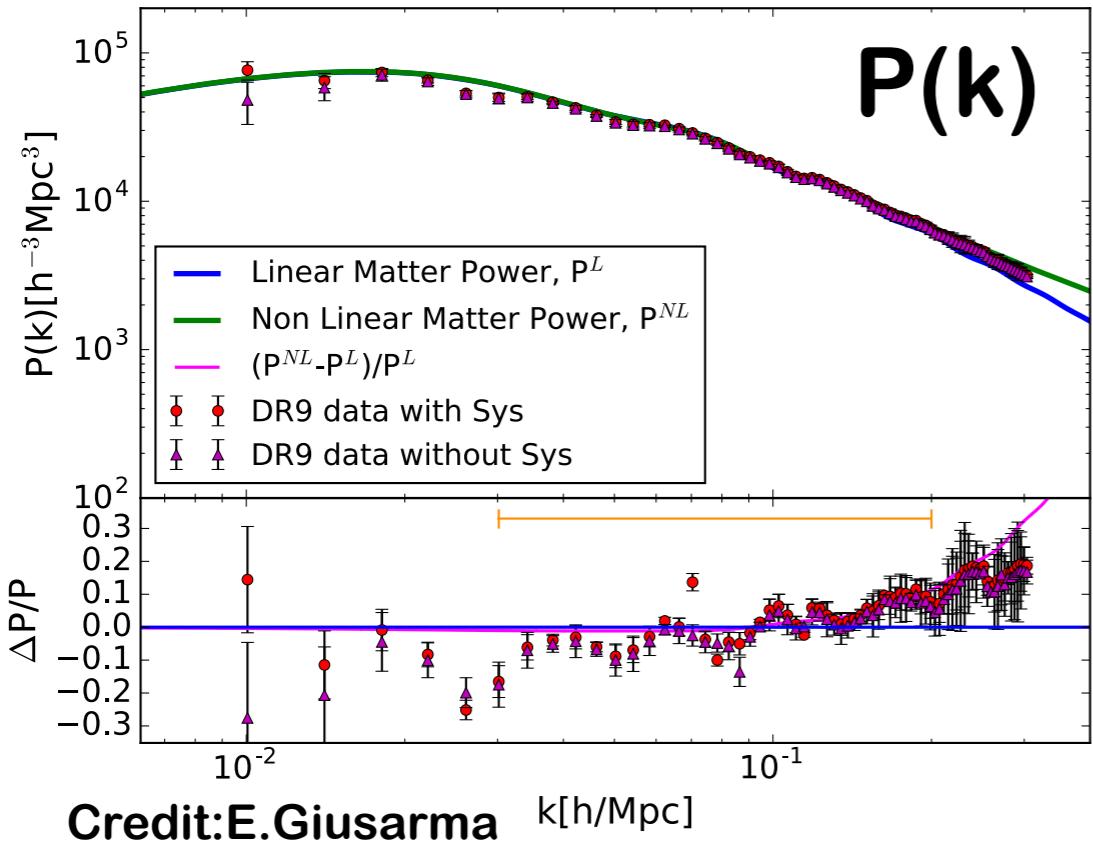

Basics of neutrino cosmology

What we observe

Planck collaboration

Basics of neutrino cosmology

← Relativistic Non-Relativistic →

$$\rho_\nu \propto N_{\text{eff}}$$

$$N_{\text{eff}} = \frac{\rho_{\text{rad}} - \rho_\gamma}{\rho_\nu^{\text{st}}} = 3.045$$

Distorsions due to non-inst decoupling
radiative corrections,
flavour oscillations
Dolgov, 1997, Mangano+, 2005
deSalas&Pastor, 2016

$$N_{\text{eff},\nu} \equiv \frac{\sum_i \rho_{\nu,i}}{\rho_{\nu,0}} = \frac{g/(2\pi)^3 \sum_i \int p_i^3 f_\nu(p_i, T_i) dp}{7/120\pi^2 T_\nu^4}$$

T~m_nu

$$\rho_\nu \propto \sum m_\nu$$

$$\sum m_\nu = \sum_{i=1,2,3} m_{\nu,i}$$

← Temperature ‘T’ increases

Effects on background quantities

Expansion rate

$$H(z)^2 = H_0^2 \left[(\Omega_c + \Omega_b)(1+z)^3 + \Omega_\gamma(1+z)^4 + \Omega_\Lambda + \frac{\rho_\nu(z)}{\rho_{\text{crit},0}} \right]$$

modifies the angular size of the sound horizon at recombination $\theta_s = r_s/D_A$

modifies the angular scale of the Silk damping $\theta_d = \frac{r_d}{D_A} \propto \frac{1/\sqrt{H}}{1/H}$

$$1 + z_{\text{eq}} = \frac{\Omega_c + \Omega_b}{\Omega_\gamma \left[1 + \frac{7}{8} \left(\frac{4}{11} \right)^{4/3} N_{\text{eff}} \right]} \quad \text{Matter-radiation equality}$$

Perturbation effects

$$k_{\text{fs}} \simeq 0.018 \Omega_m^{1/2} \left(\frac{m_\nu}{1 \text{ eV}} \right)^{1/2} h \text{Mpc}^{-1}$$

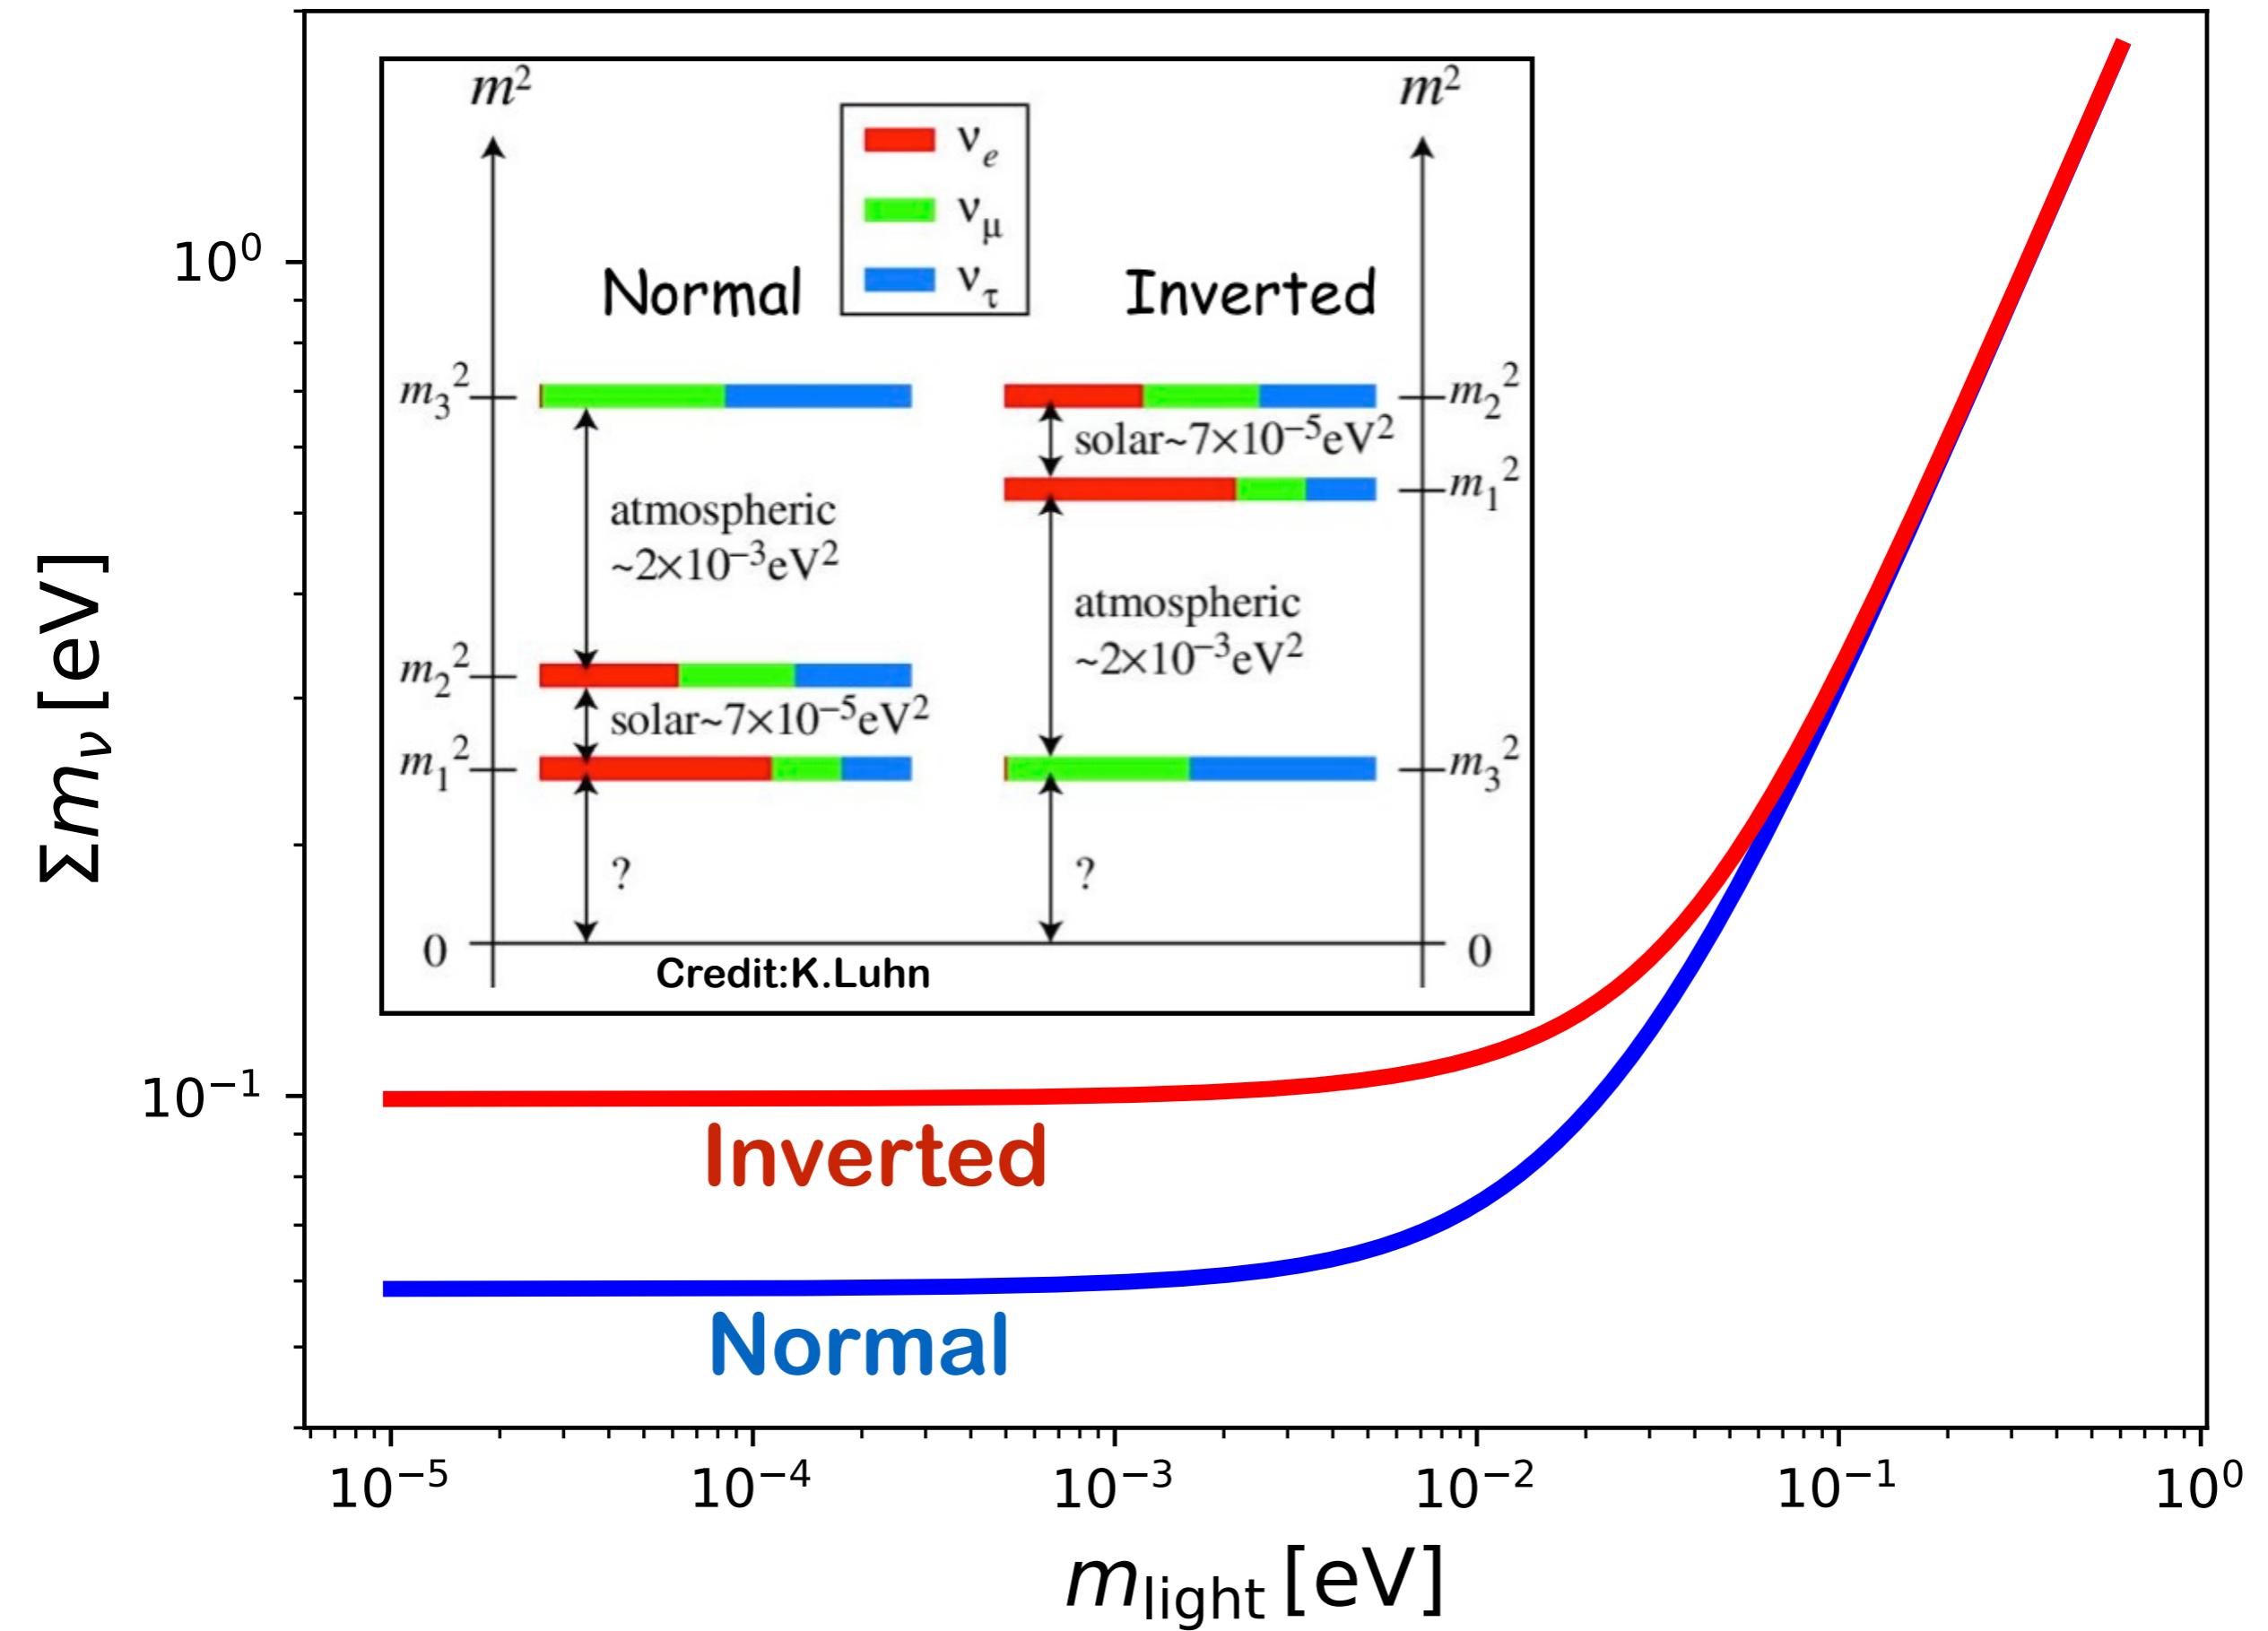

Free streaming scale

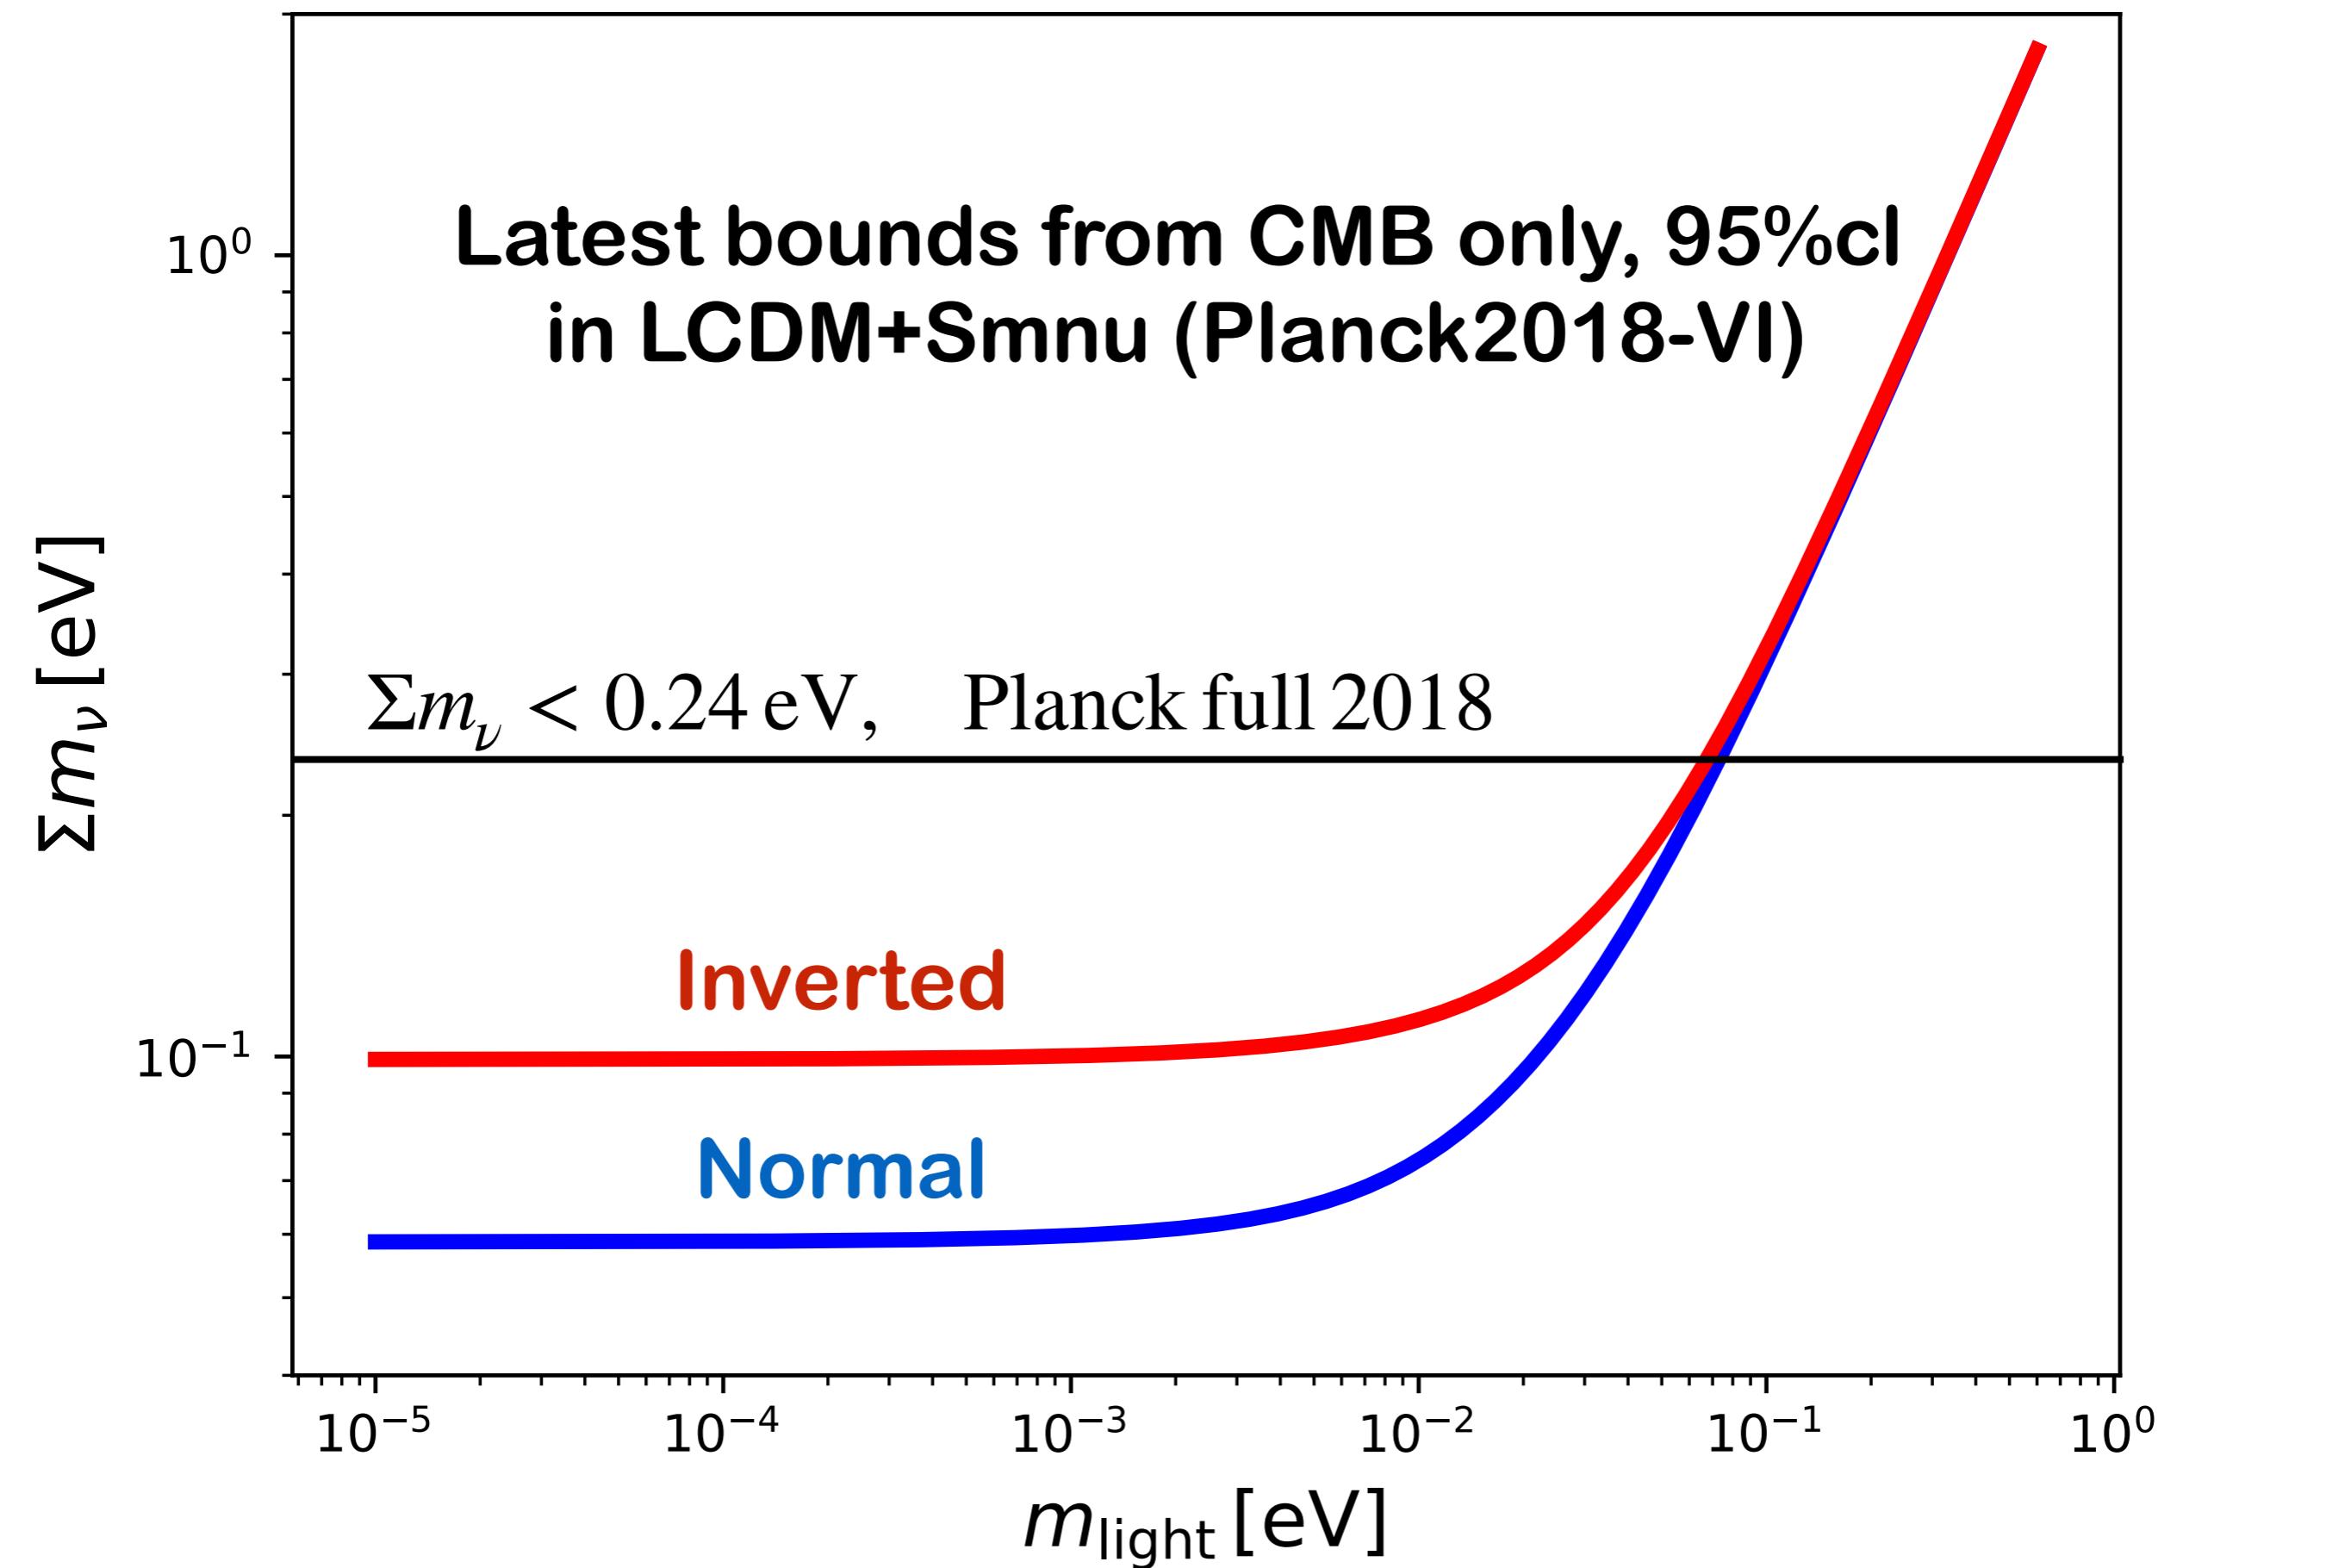

$$\delta_m(k \gg k_{\text{fs}}) \propto a^{1 - (3/5)\Omega_\nu/\Omega_m}$$

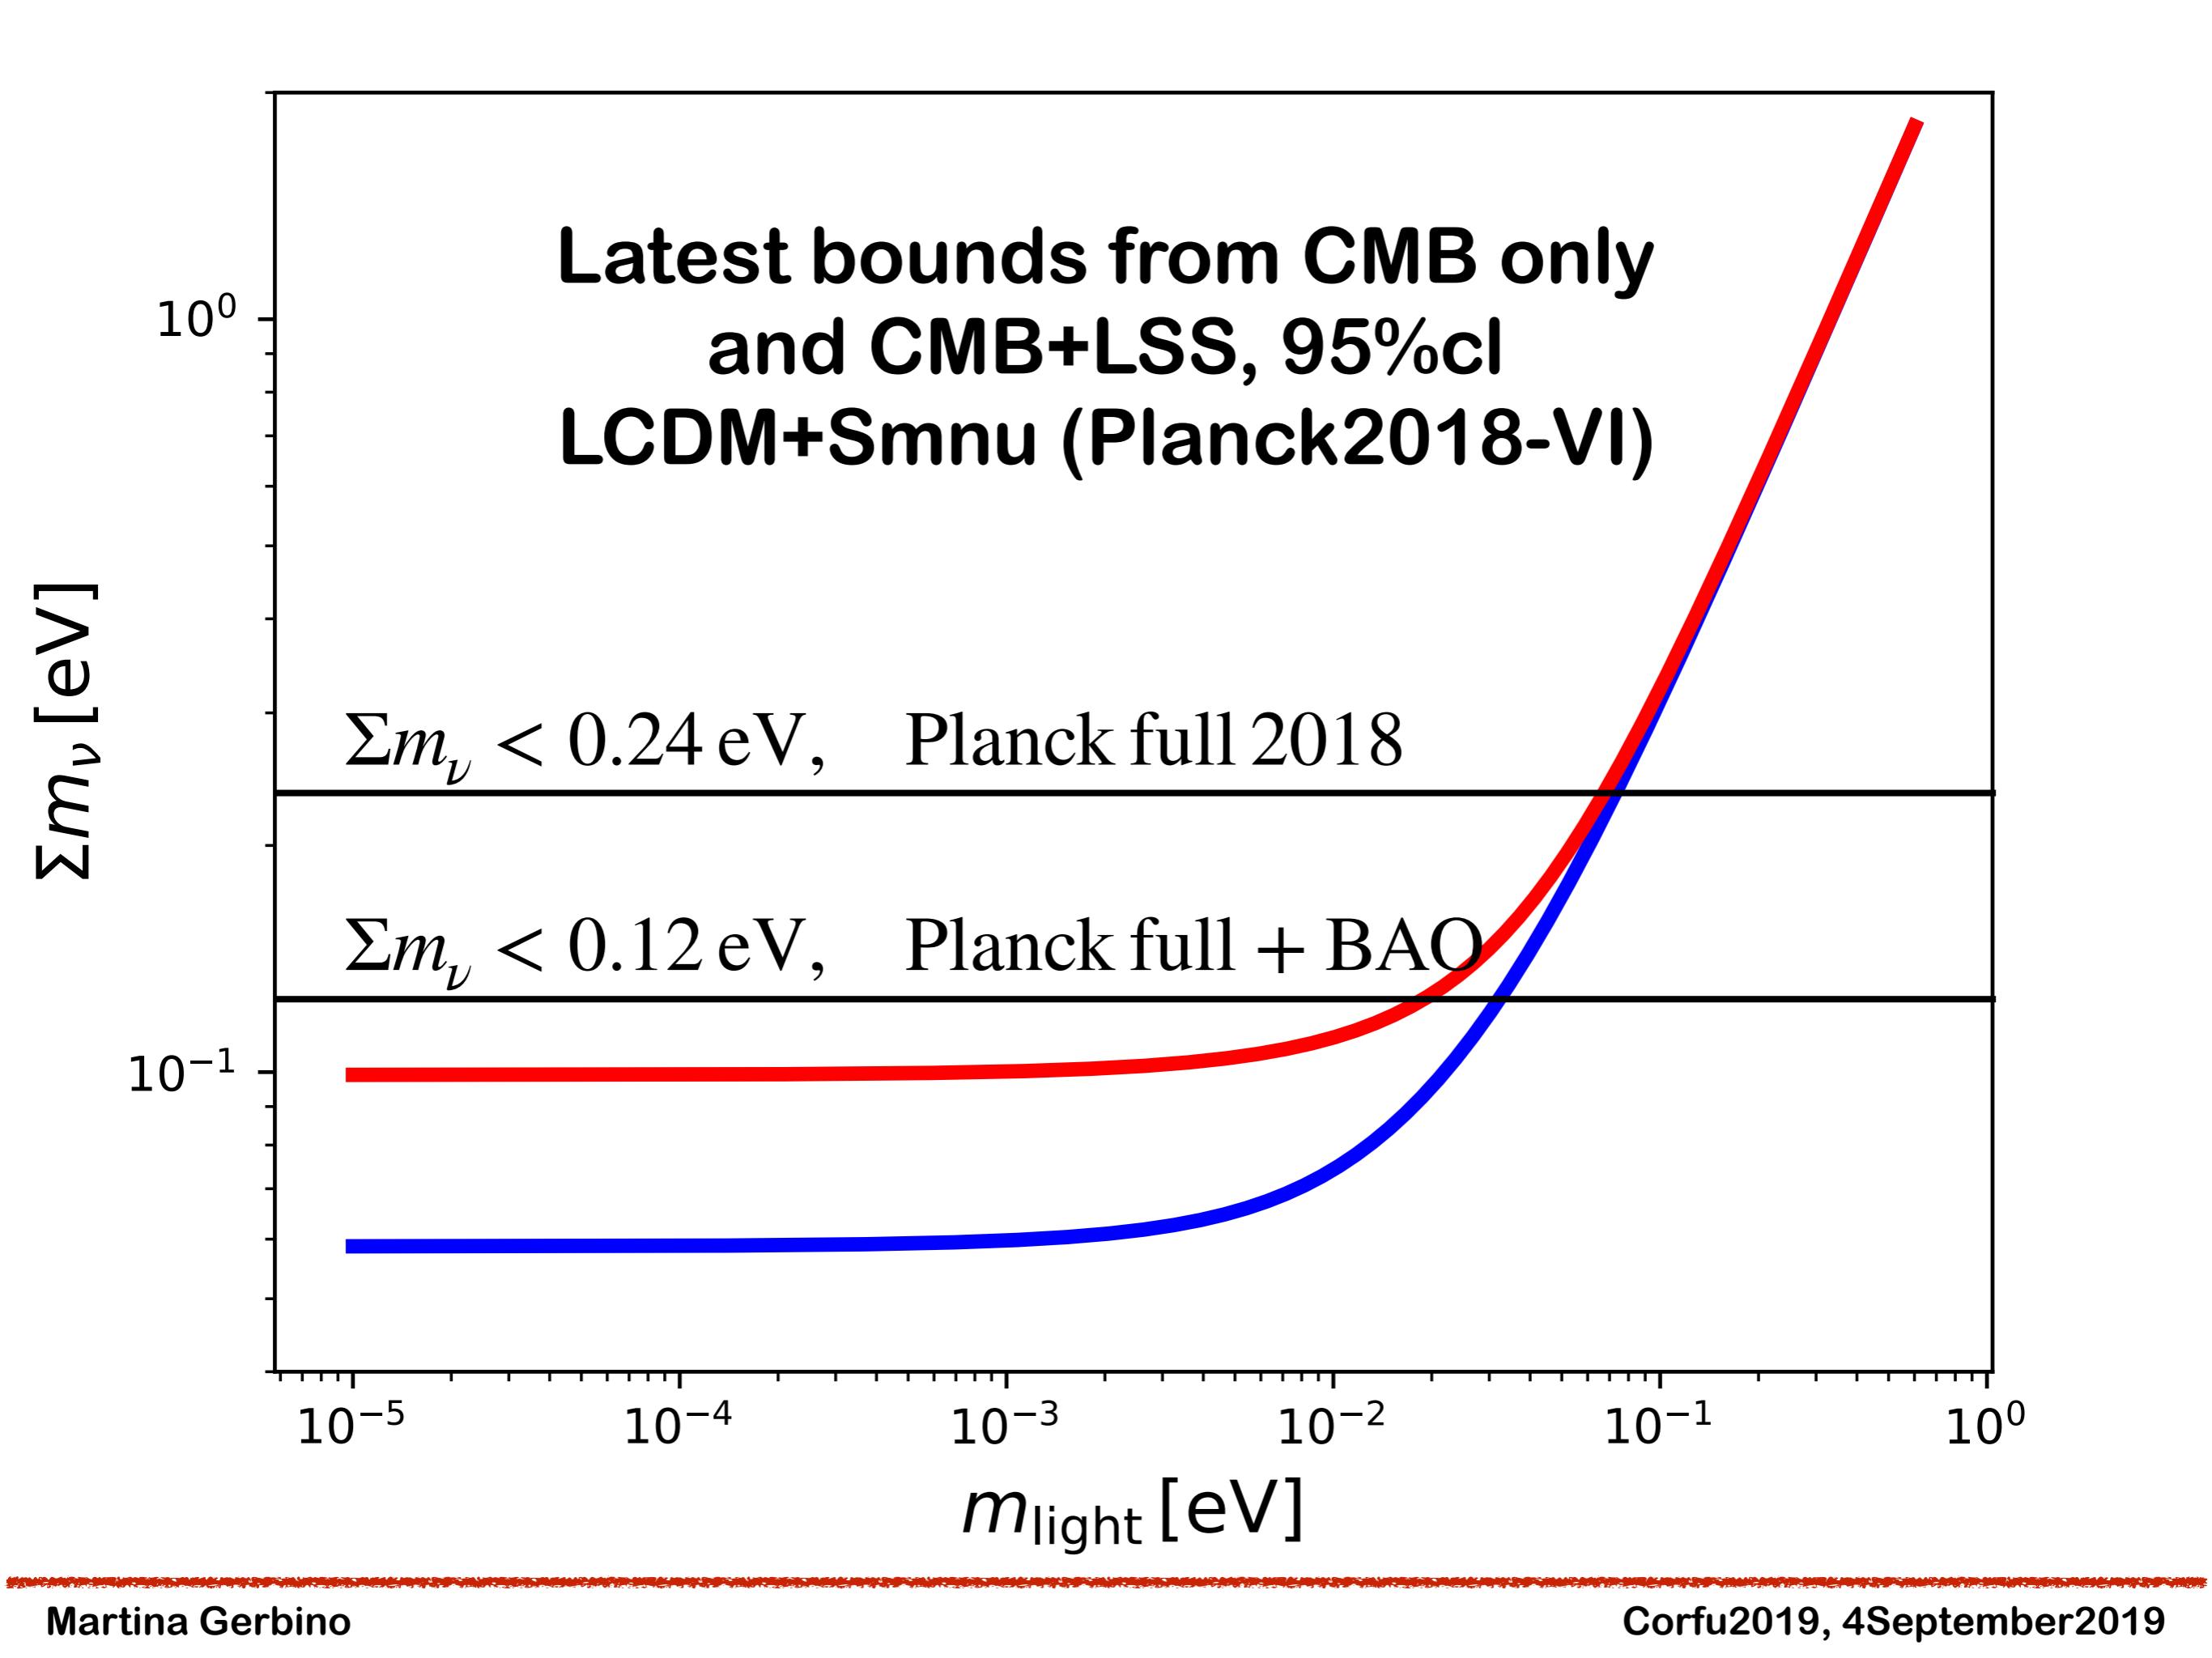

Suppressed growth

$$k_p r_s + \phi = p\pi$$

Acoustic phase shift

Fairly representative of
broadening in extended models
**(LCDM+Smnu+ curvature, dark energy,
running, etc.)**

$\Sigma m_\nu < 0.37 \text{ eV}, \Lambda \text{CDM} + \Sigma m_\nu + w_0, w_a$

$\Sigma m_\nu < 0.13 \text{ eV}, \Lambda \text{CDM} + \Sigma m_\nu$

TBN: constraints
from 2015 data+tau prior
(Vagnozzi+[incl.MG], 2018)

$\Sigma m_\nu [\text{eV}]$

10^{-1}

10^{-5}

10^{-4}

10^{-3}

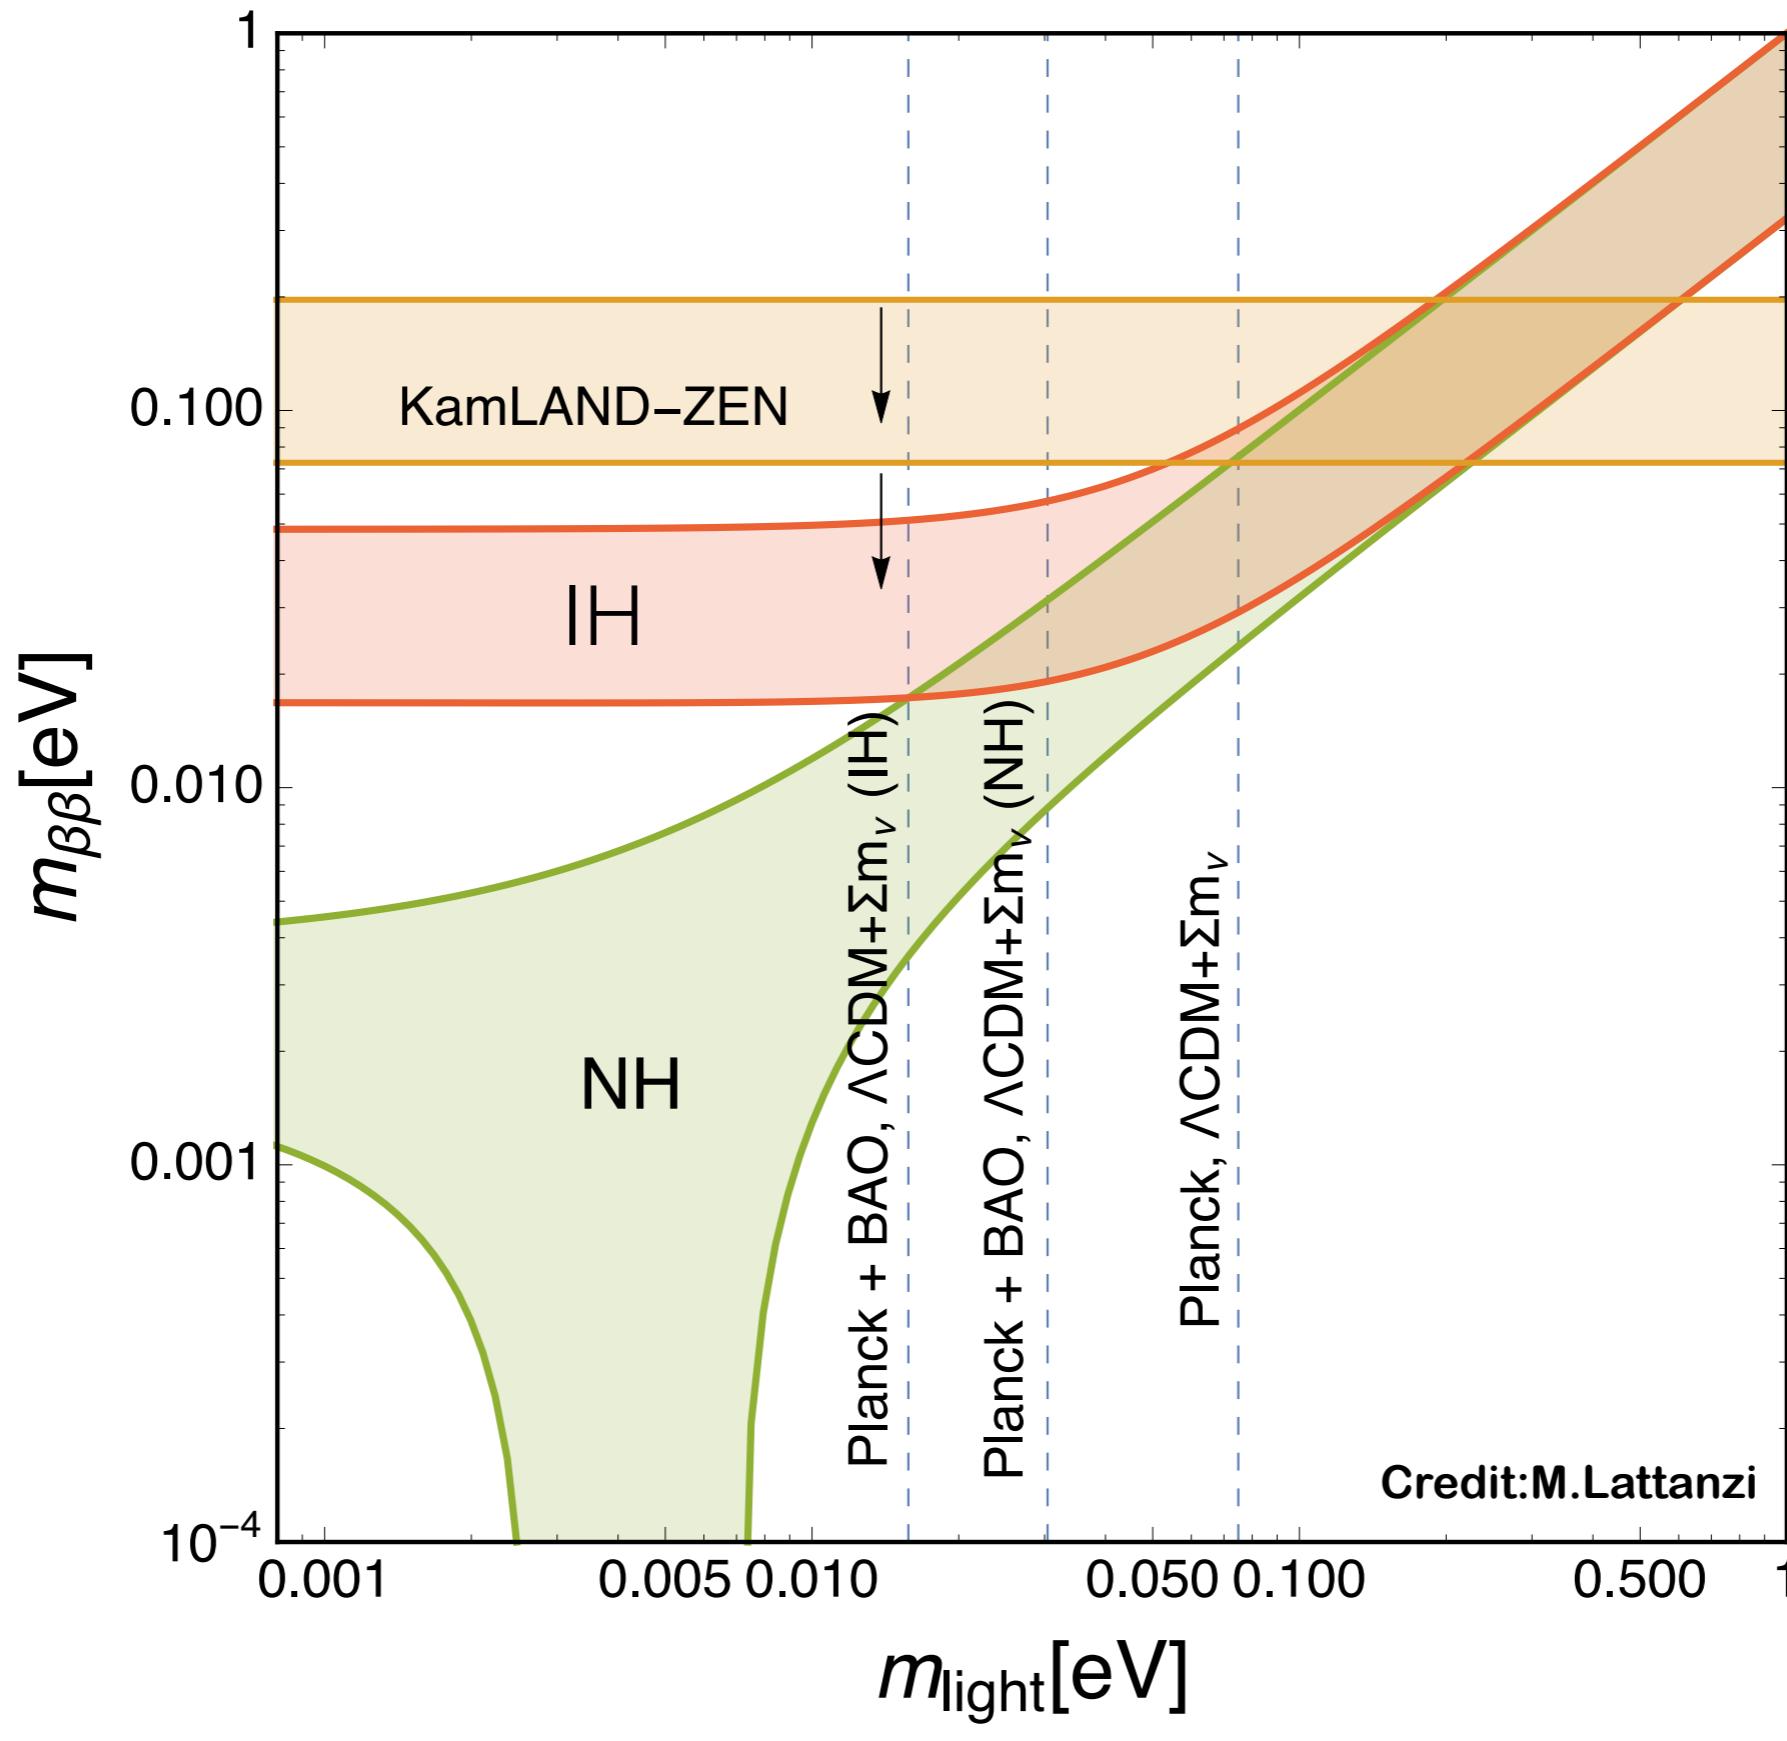

10^{-2}

10^{-1}

10^0

$m_{\text{light}} [\text{eV}]$

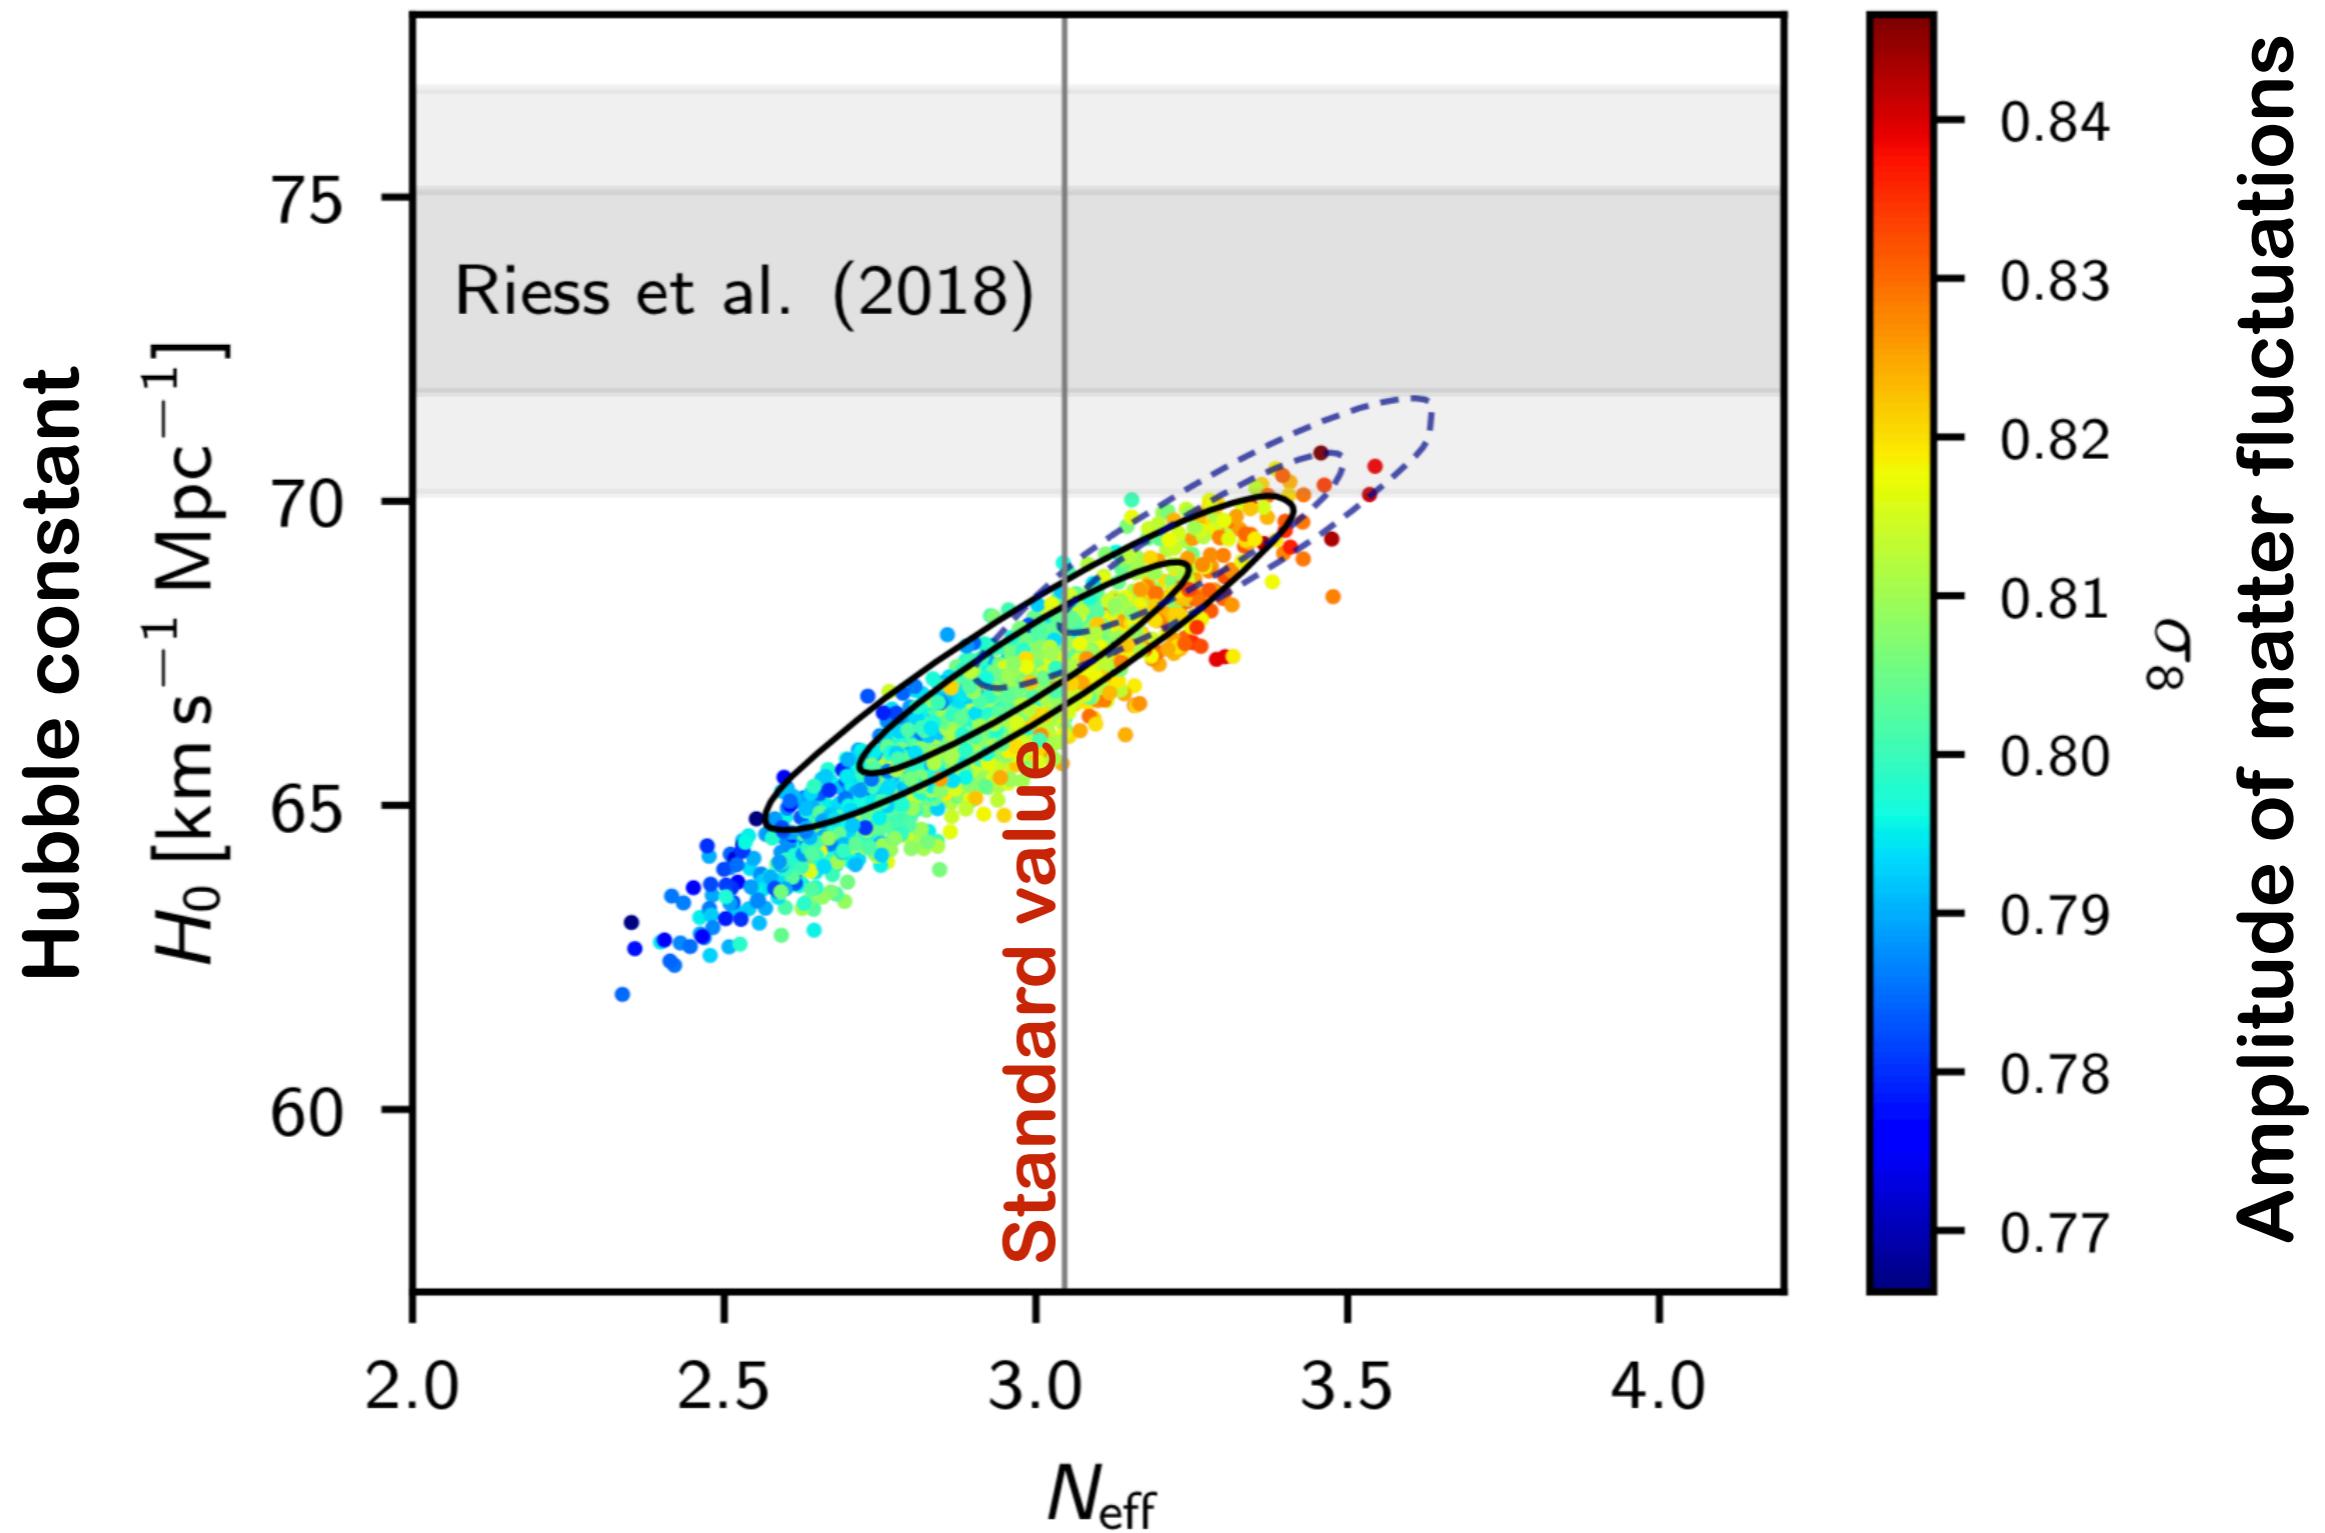

Majorana effective mass probed by neutrinoless double-beta decay

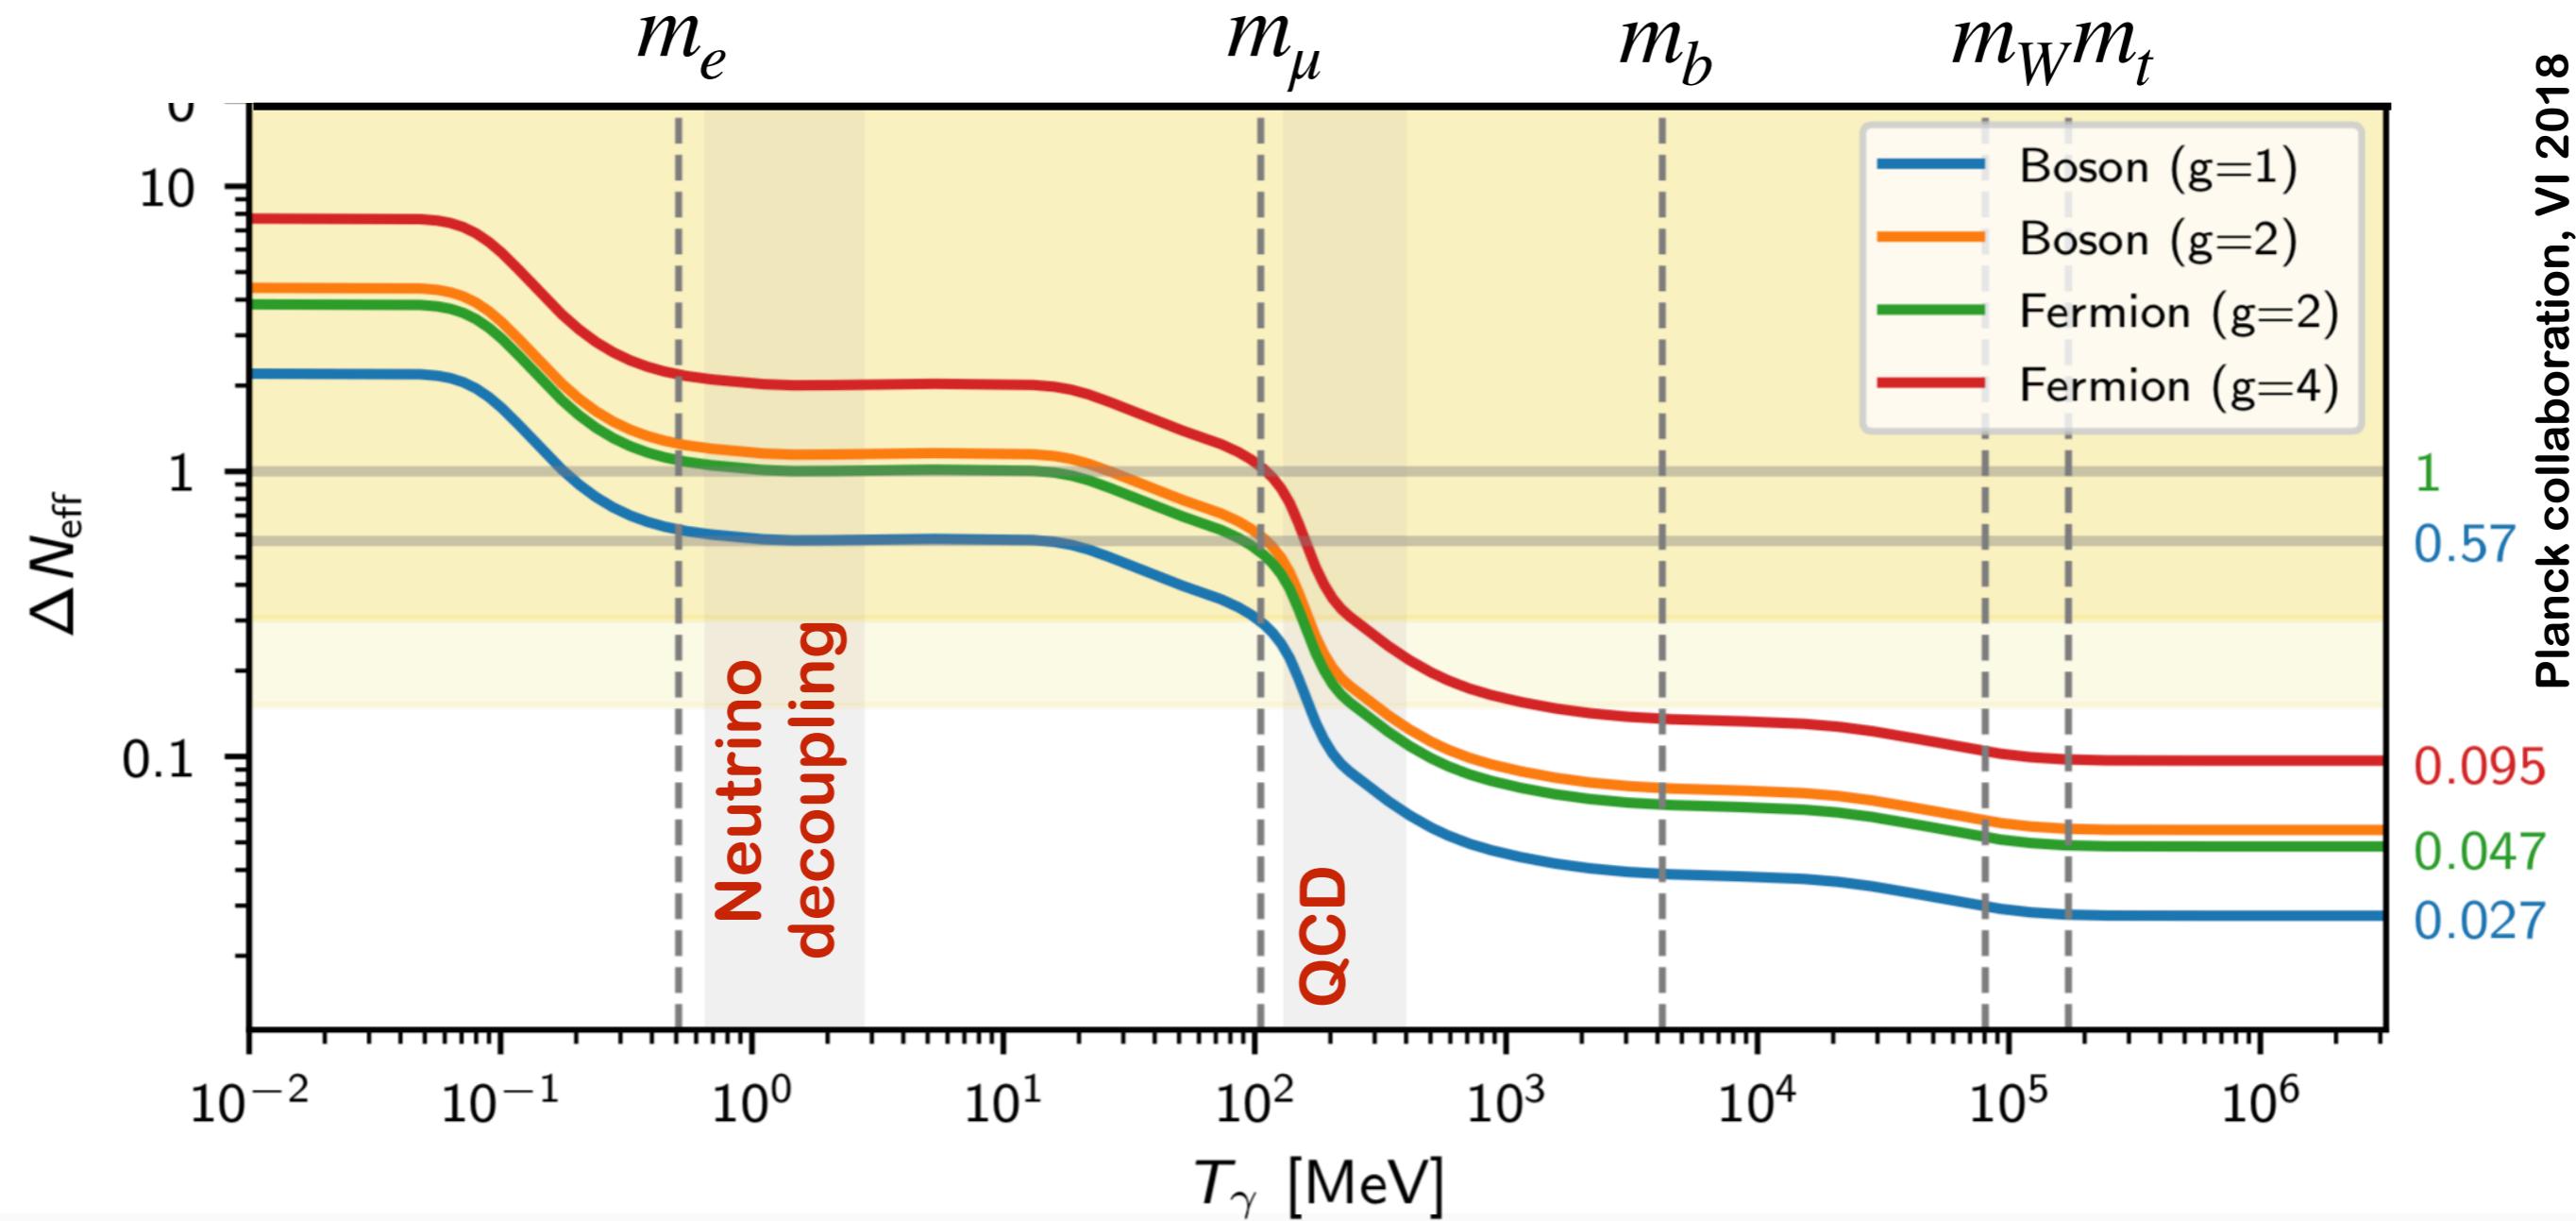

Lightest neutrino mass state

Current limits on N_{eff}

$N_{\text{eff}} = 2.99^{+0.34}_{-0.33}, 95\% \text{ c.l.}, \text{Planck2018 + BAO}$

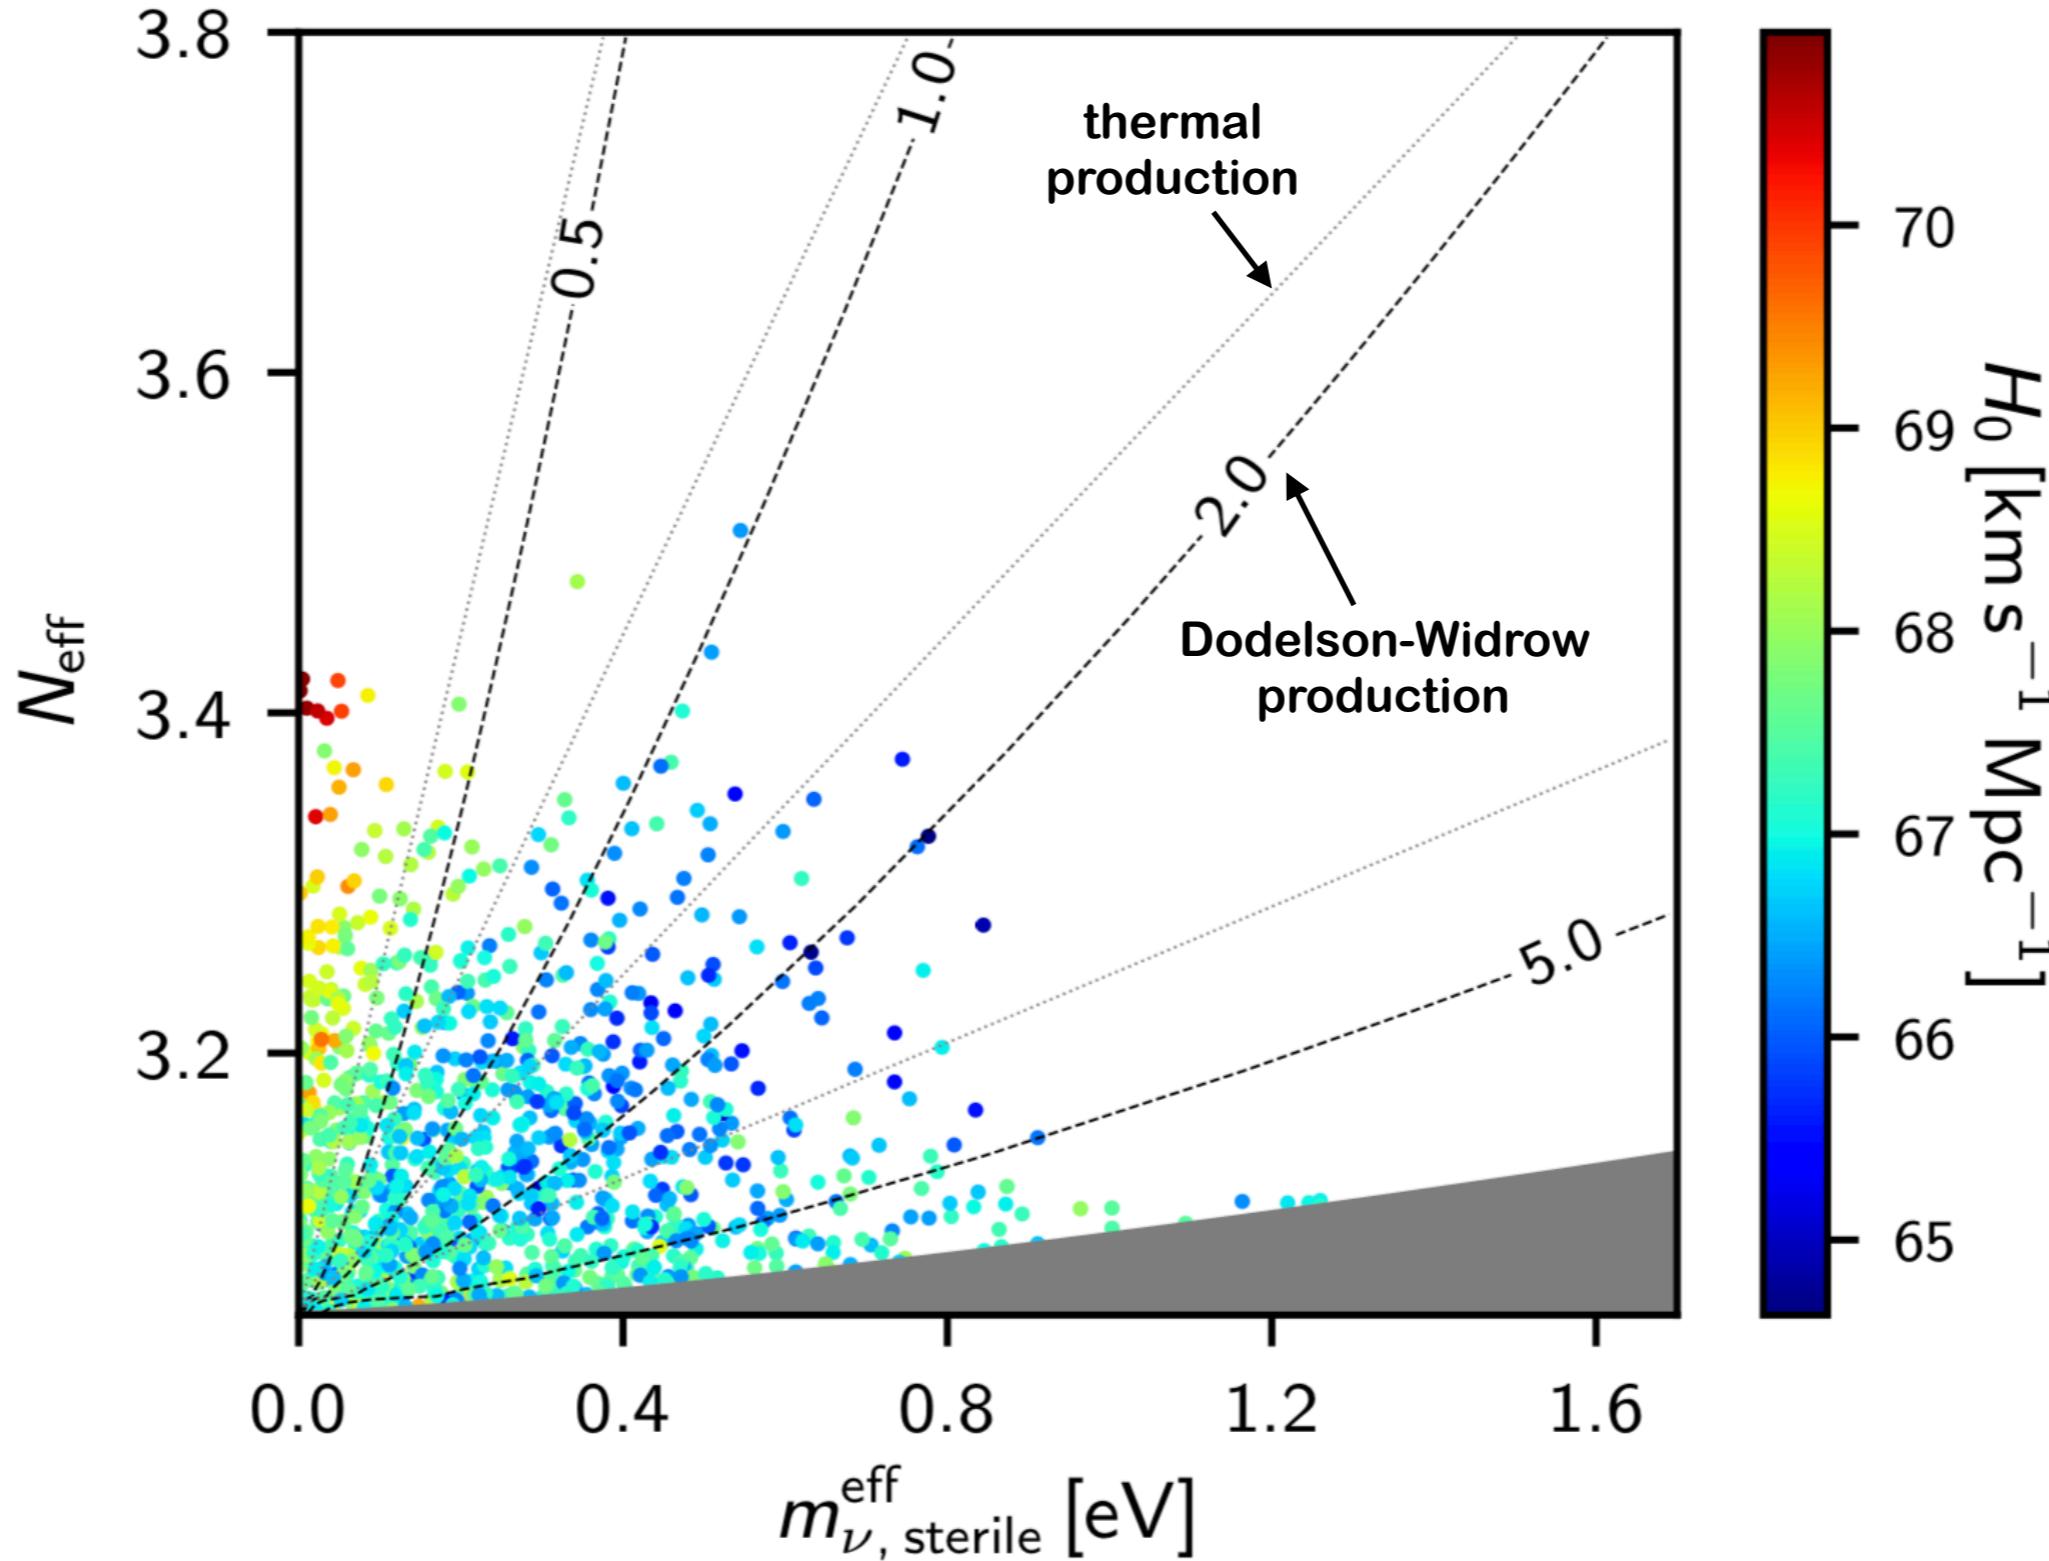

Neff as a proxy for extra light species

Presence of additional fully thermalised species decoupling
after QCD phase transition excluded at 95% c.l.

Current limits on Neff-meff

Planck collaboration, VI 2018

~eV thermalised sterile neutrino excluded at 7sigma

Non-standard models needed to make SBL compatible with cosmology

What next in neutrino cosmology

A new generation of ultimate cosmological surveys is approaching: Simons Observatory, Euclid, LiteBIRD, CMB-S4, DESI, LSST, SKA ...

Does it mean that we are moving:

- 1) Towards the first detection of the neutrino mass scale?
- 2) Towards the first probe of the physics of neutrino decoupling, and of BSM content at very early times?

How to achieve robustness

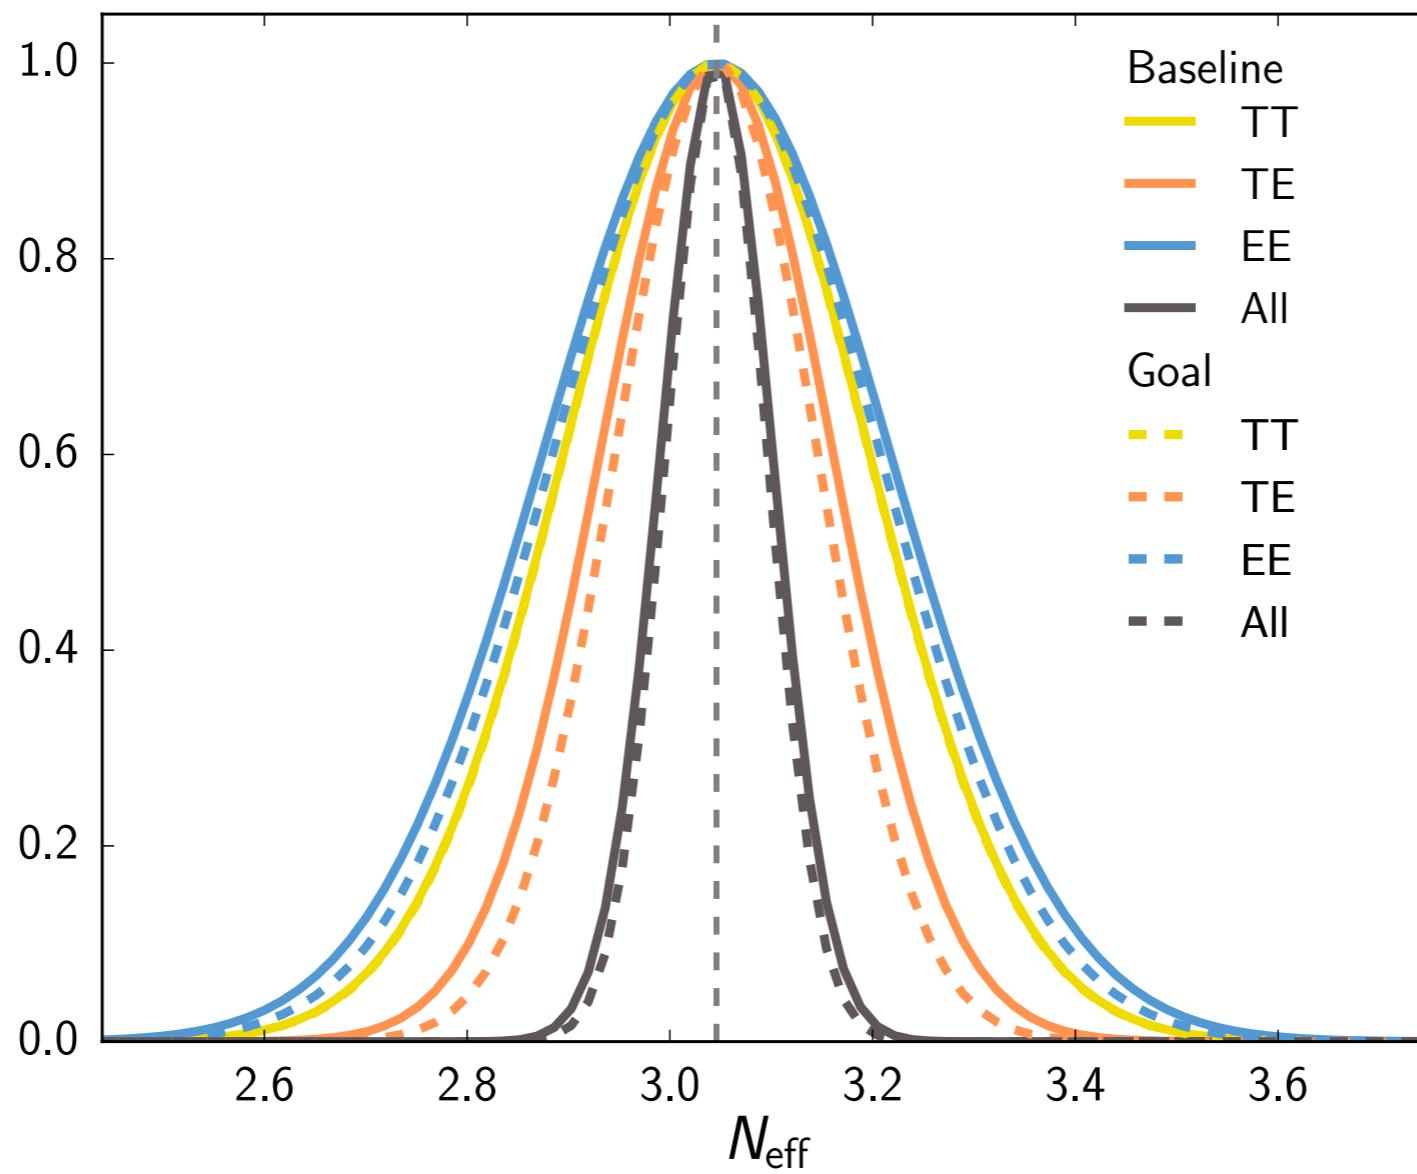

- 1) **External redundancy and complementarity:**
Individual probes of very high and comparable sensitivity, cross-correlations,...
- 2) **Internal redundancy and complementarity:**
Individual channels (e.g. temperature and polarisation; shear and galaxy; ...) of high and comparable sensitivity
- 3) **Know your instruments:** extensive work on ‘mock’ calibration, sensitivity and systematics in preparation of the real analysis

Route to robust neutrino mass bounds

- CMB lensing from SO combined with DESI BAO
$$\sigma(\Sigma m_\nu) = 0.04 \text{ eV} [0.03 \text{ eV}]$$
- Sunyaev-Zeldovich cluster counts from SO calibrated with LSST weak lensing
$$\sigma(\Sigma m_\nu) = 0.04 \text{ eV} [0.03 \text{ eV}]$$
- thermal SZ distortion maps from SO combined with DESI BAO
$$\sigma(\Sigma m_\nu) = 0.05 \text{ eV} [0.04 \text{ eV}]$$
- legacy SO dataset combined with cosmic-variance-limited measurement of reionization optical depth τ
$$\sigma(\Sigma m_\nu) = 0.02 \text{ eV}$$

SO collaboration, 2018

Route to improved bounds on Neff

Primary CMB temperature and polarization power spectra from SO

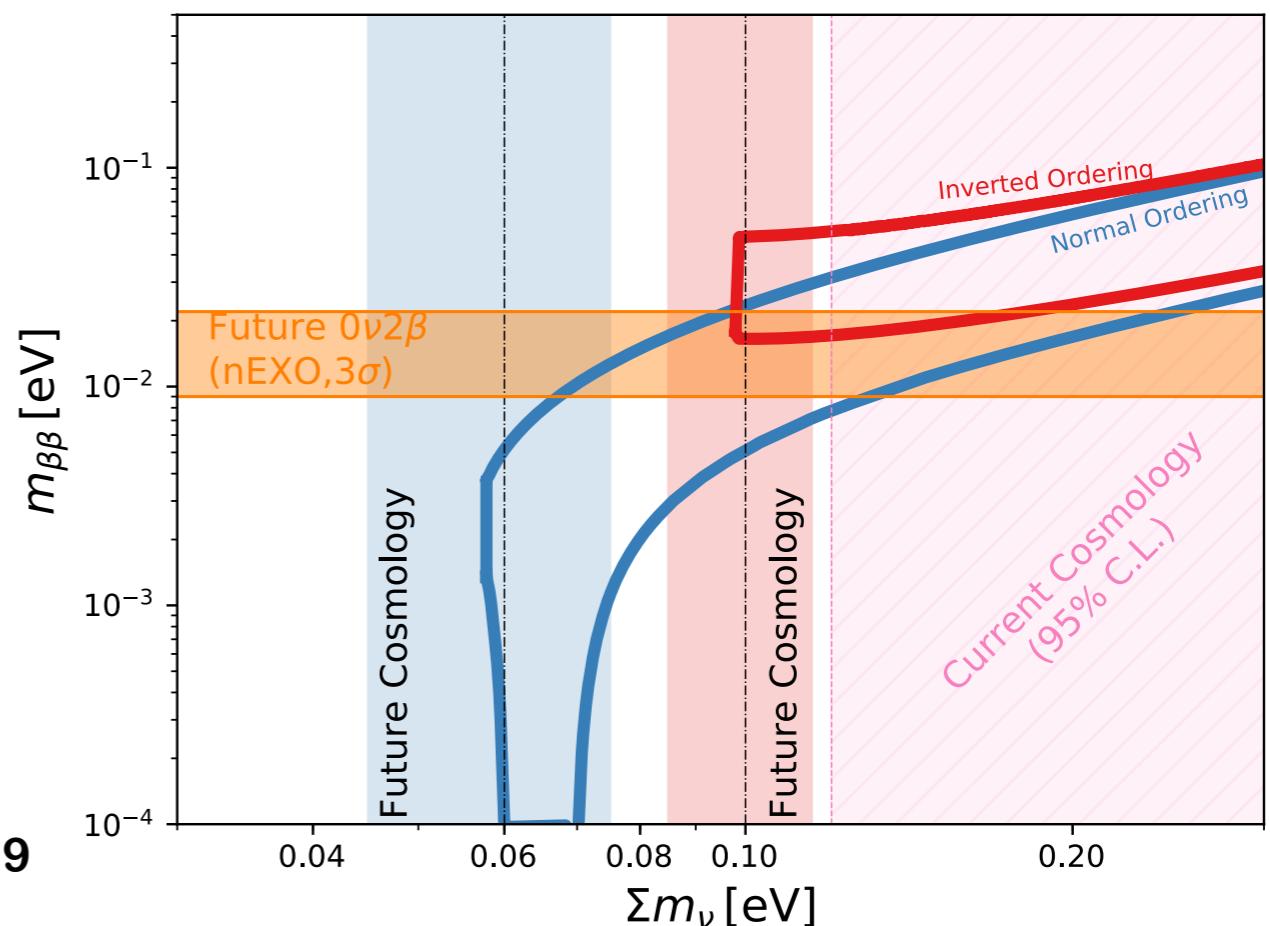

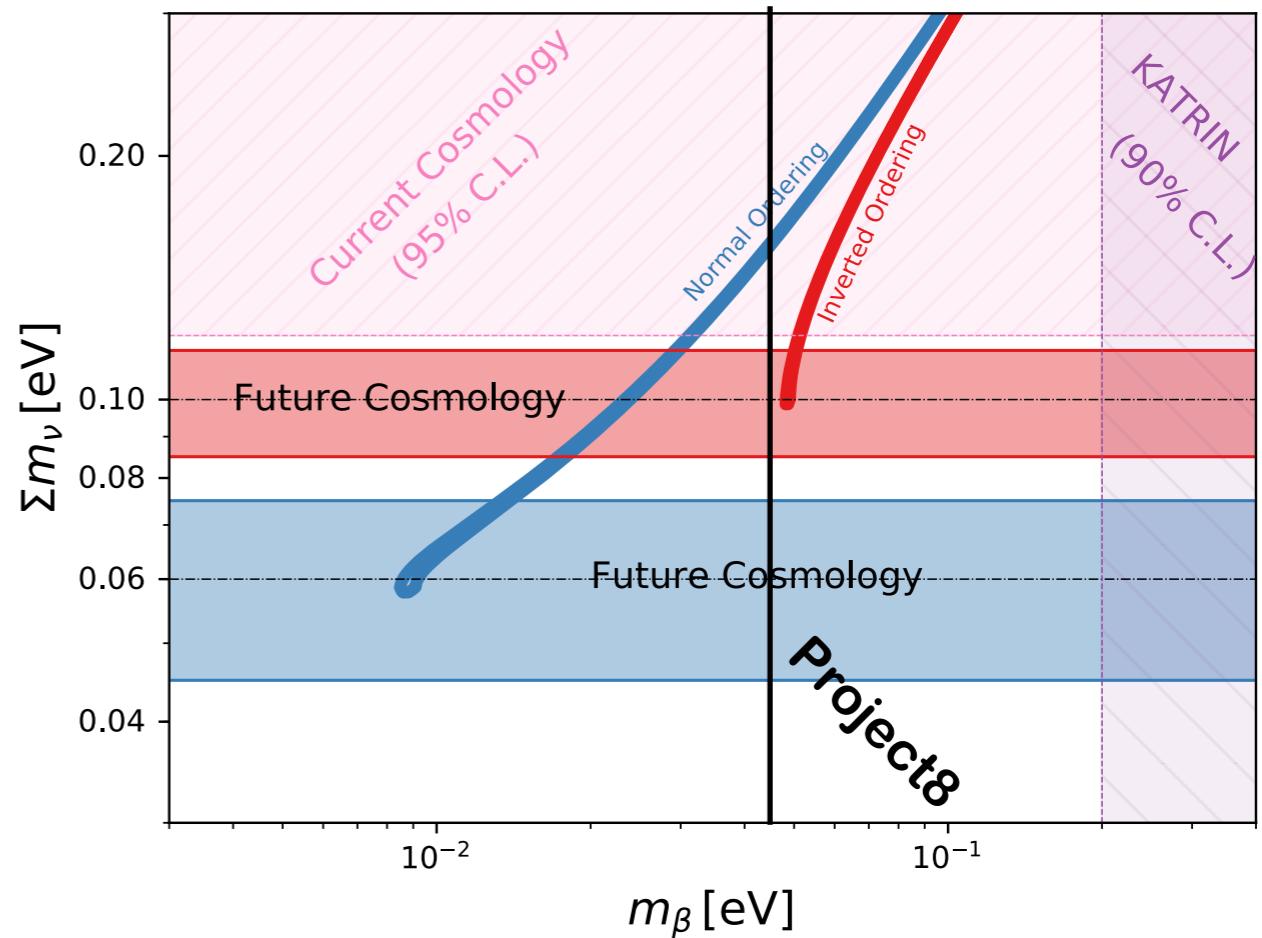

$$\sigma(N_{\text{eff}}) = 0.07 [0.05]$$

SO collaboration, 2018

**Expected sensitivity
from S4-like surveys**
~15 meV

**Complementarity with
laboratory searches:**
 1) independent cross-
checks
 2) interesting scenarios if
in disagreement

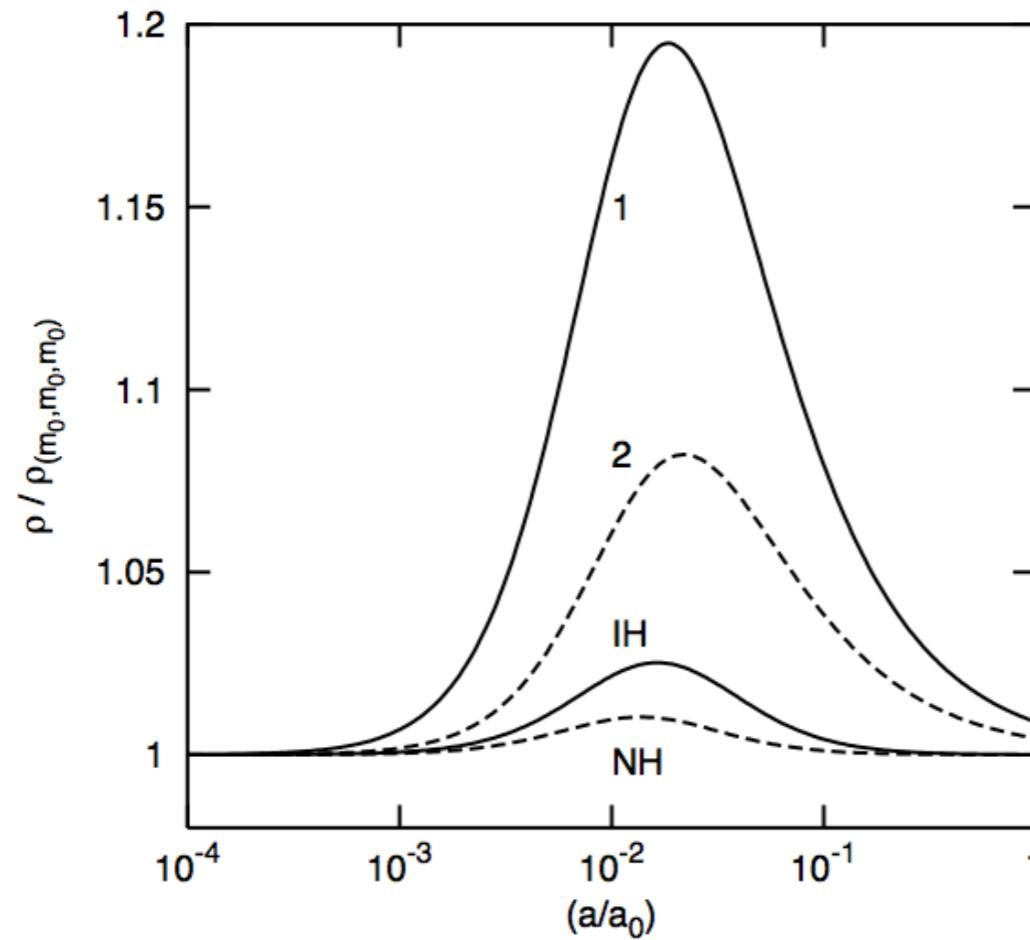

Stage-4 collaboration, 2019

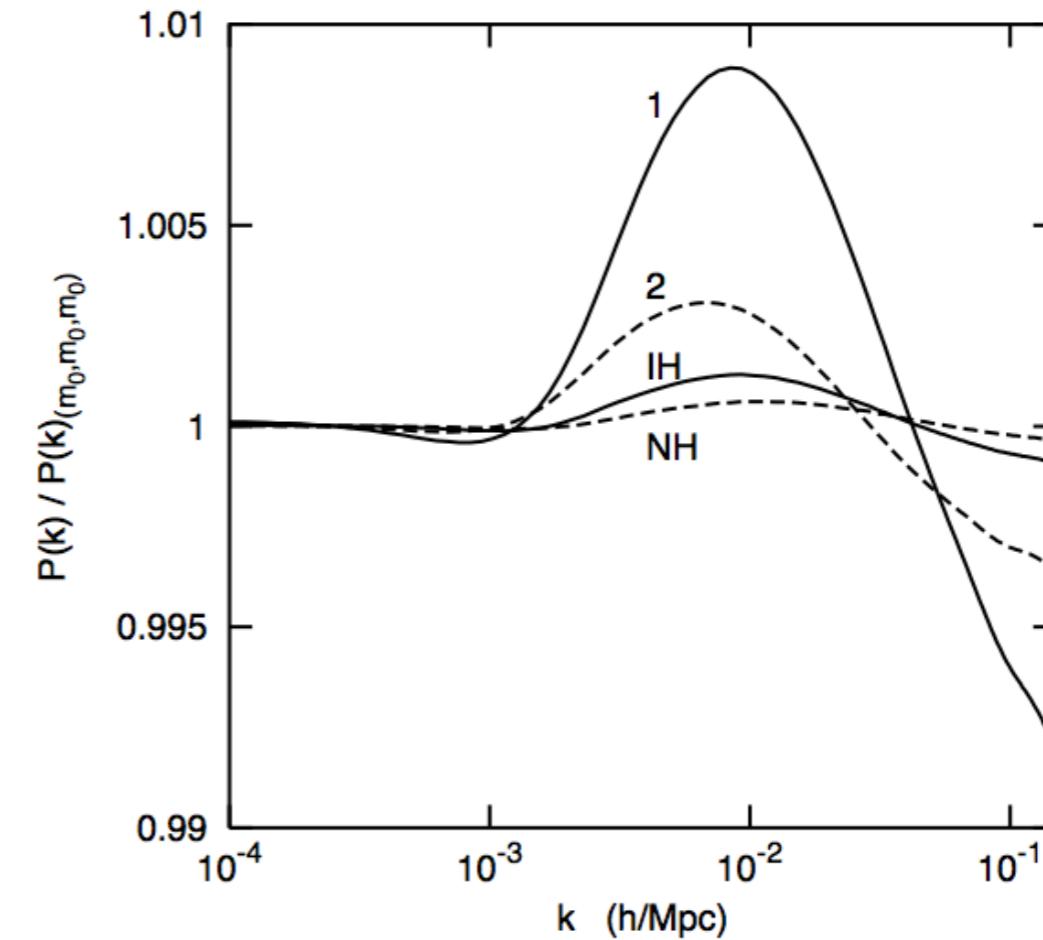

Sensitivity to the hierarchy

Physical effects due to different distribution of the sum of the masses for the 2 hierarchies

Total nu energy density

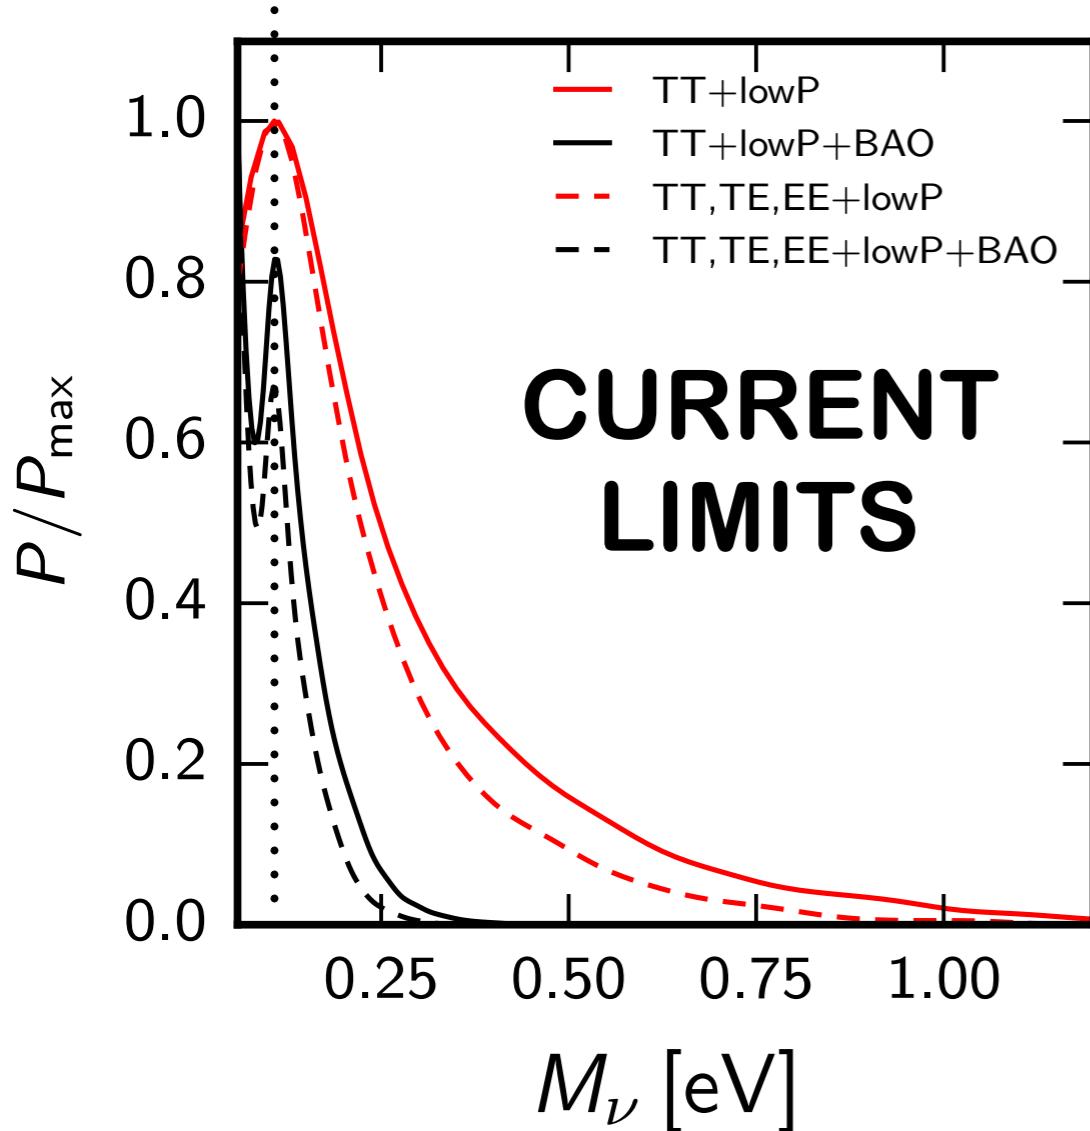

Matter power spectrum

Lesgourgues&Pastor, 2006

Are current (and future) data sensitive to these effects?
How much?

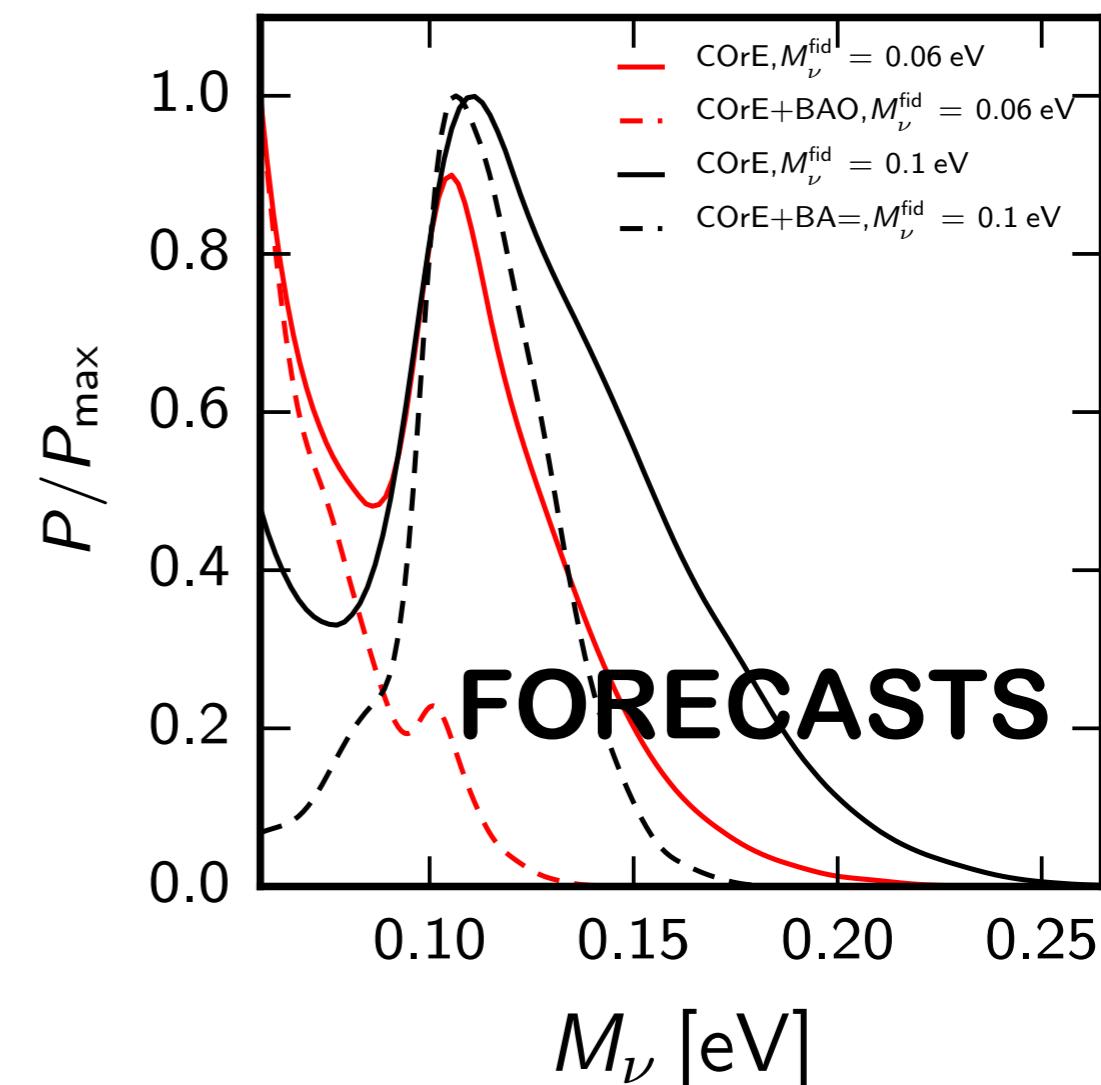

Sensitivity to the hierarchy

$$\mathcal{P}(h = NH) : \mathcal{P}(h = IH)$$

..... 3:2

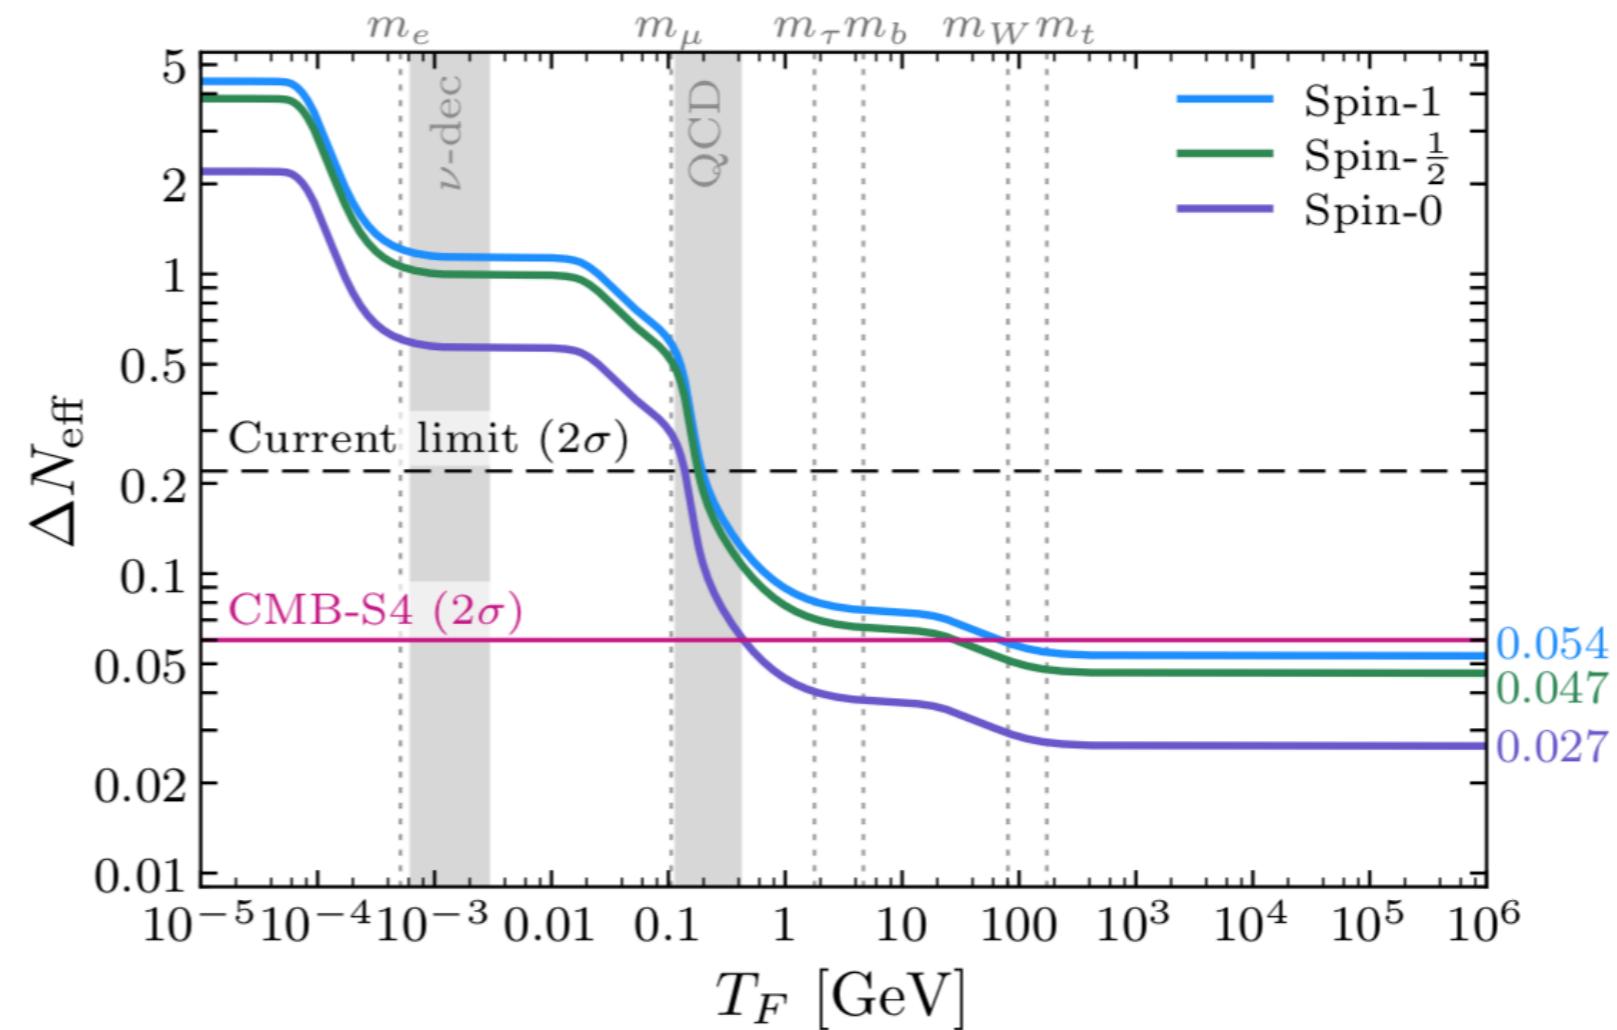

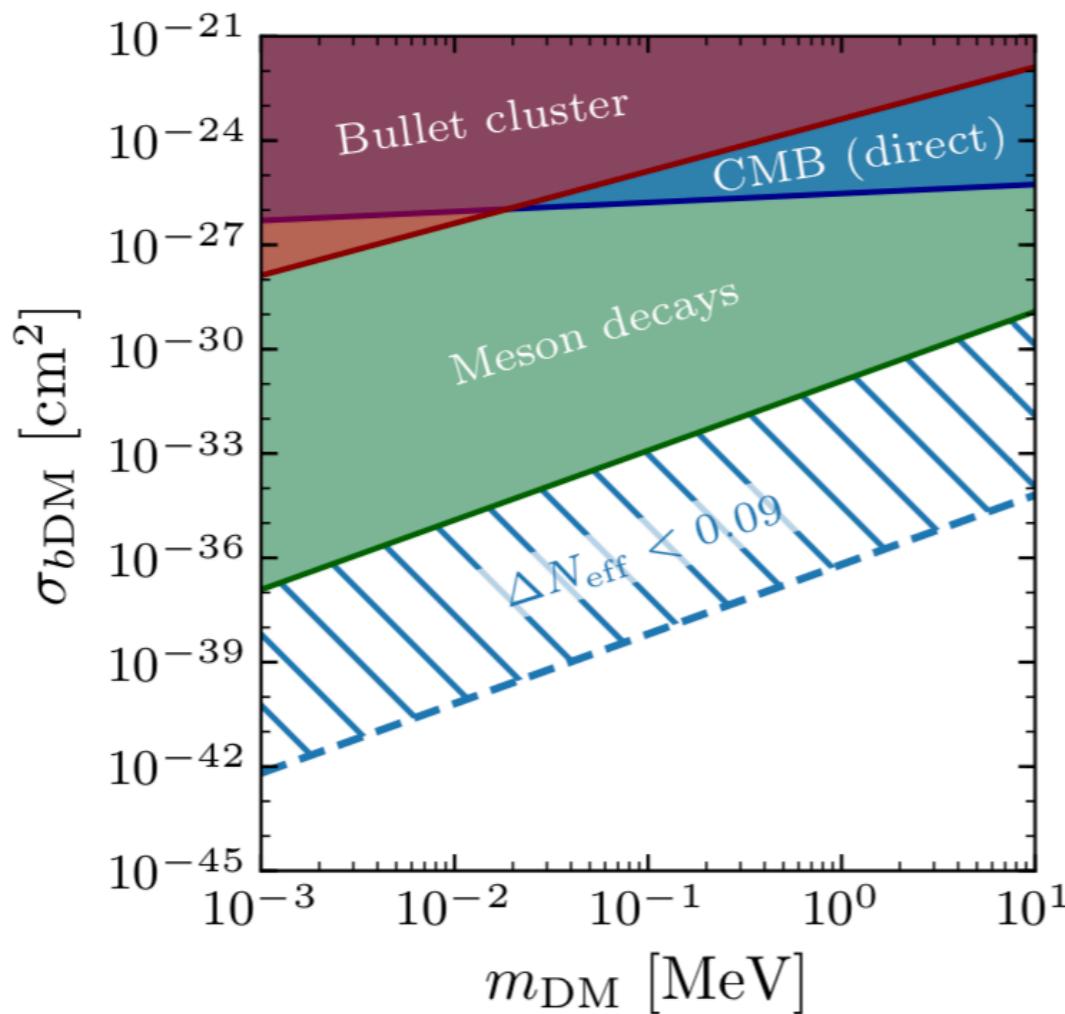

See also Hannestad&Schwetz,2016

$$\mathcal{P}(h = NH) : \mathcal{P}(h = IH)$$

..... 0.06eV mass -> 9:1
..... 0.1eV mass -> 1:1

Route to improved bounds on Neff

Stage-4 collaboration, 2019

CMB-S4 will achieve sensitivity 1) to relics that froze out well before the quark-hadron phase transition; 2) to the details of neutrino decoupling

sigma(Neff)=0.03

CONCLUSIONS

Determine CnB properties from neutrino peculiar effects on cosmological observables

Strong and robust constraints from cosmology

Neutrino masses: getting closer to cornering inverting hierarchy

N_{eff} : no preference for an additional thermalised species

Next generation surveys would probe the physics of non-instantaneous decoupling and detect the neutrino mass scale with high statistical significance

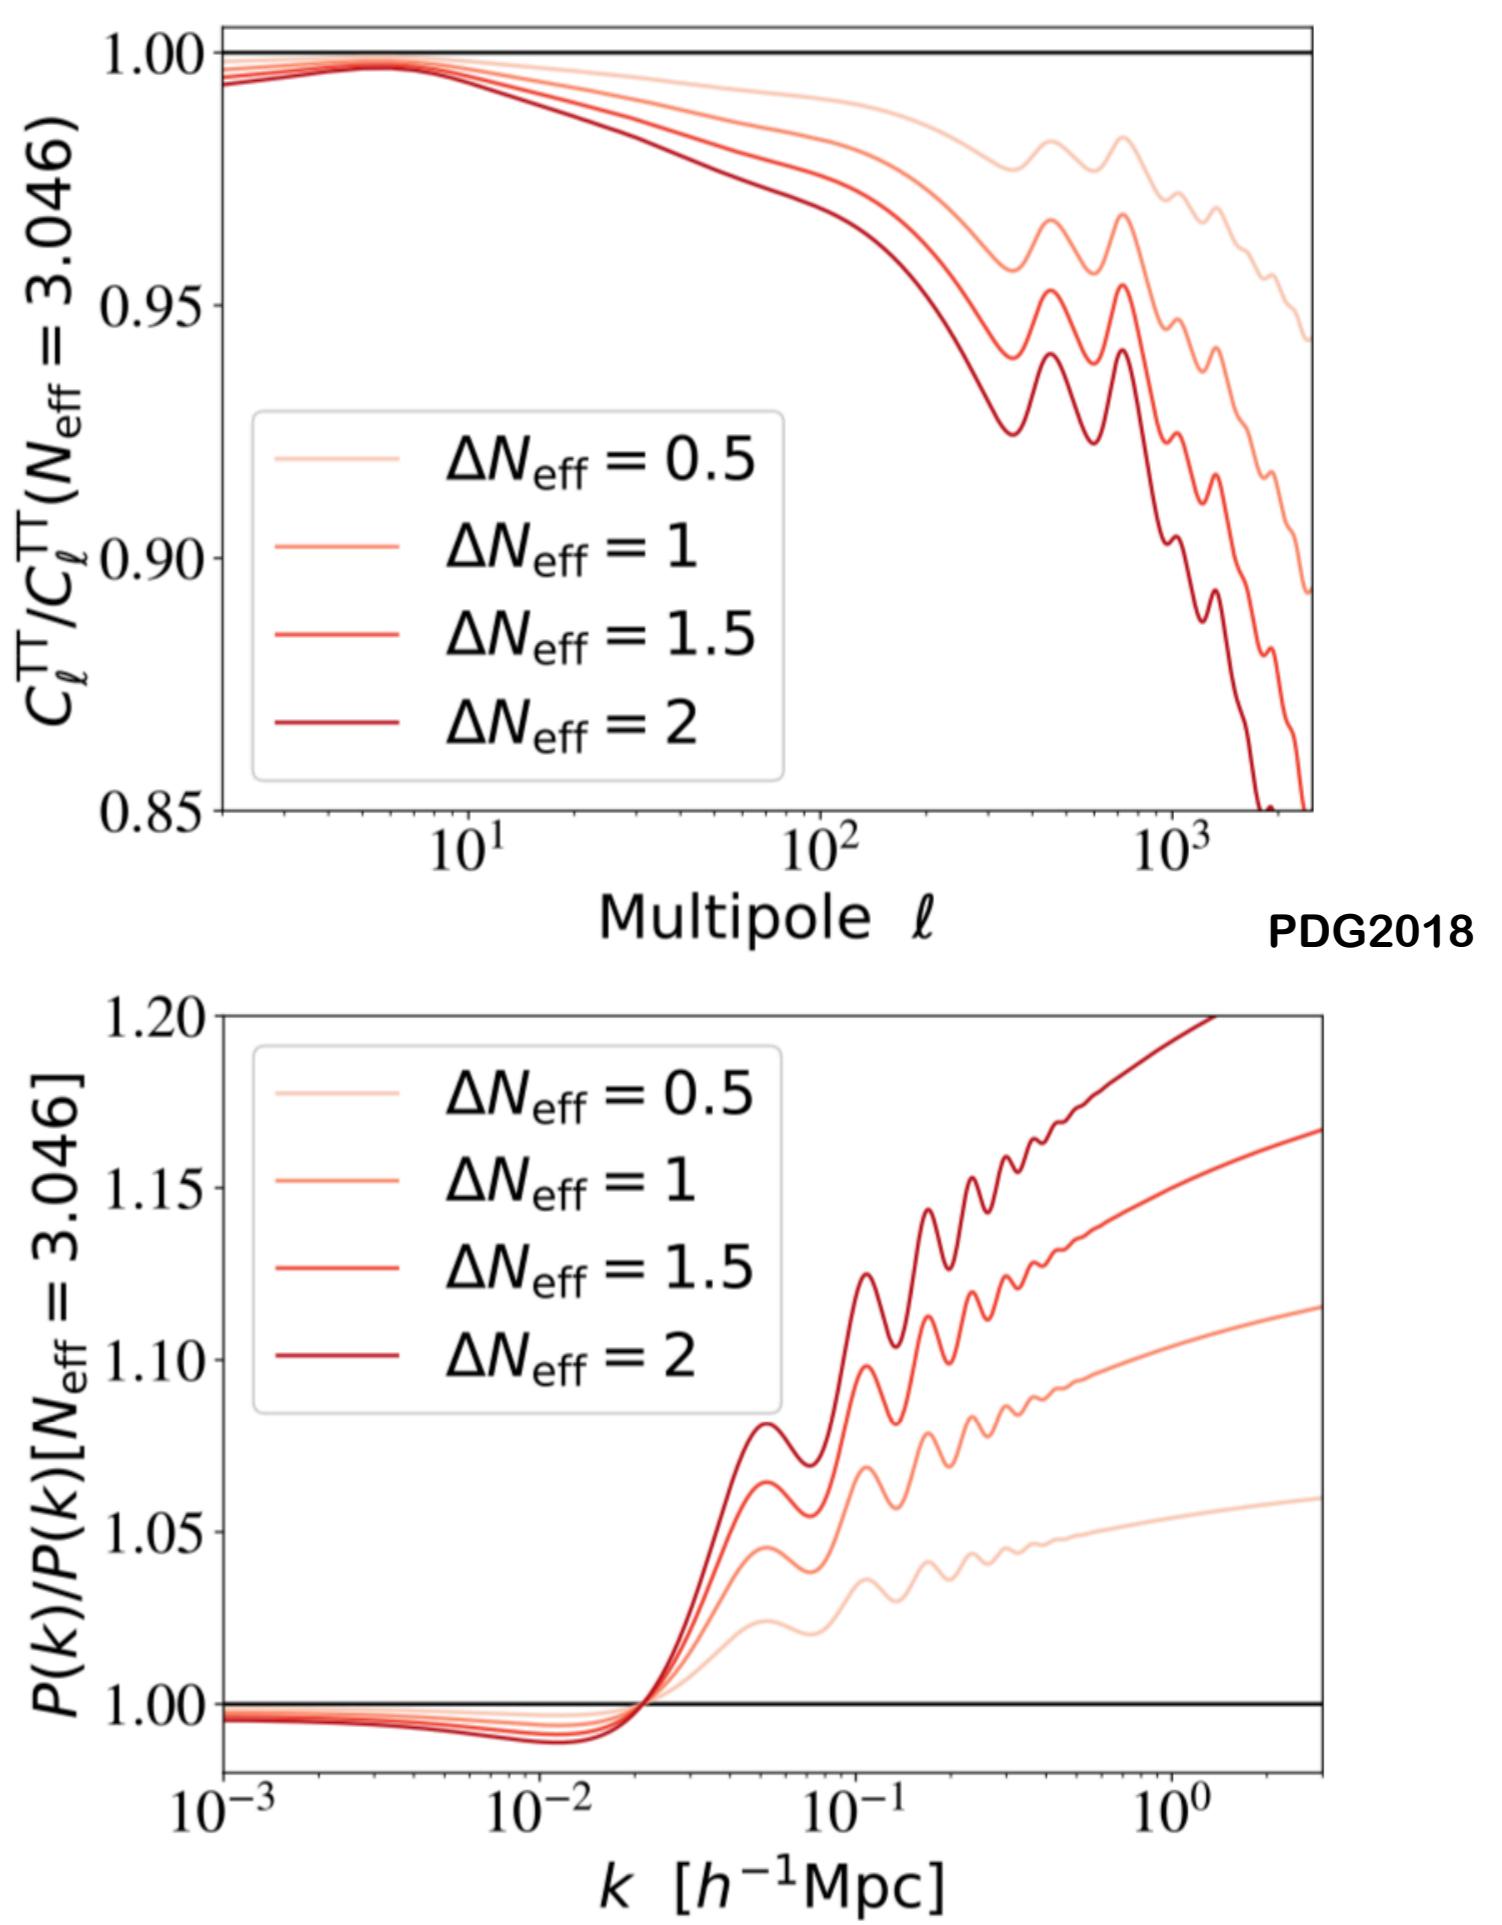

They would probe BSM scenarios and be complementary to lab and astro searches

Matter power spectrum

Route to robust neutrino mass bounds

-

Cosmic-variance-limited measurements of tau

Neff as a proxy for extra light species

$$\rho_{\text{rad}} = \rho_\gamma \left(1 + \frac{7}{8} \left(\frac{4}{11} \right)^{\frac{4}{3}} (N_{\text{eff},\nu} + \Delta N_{\text{eff}}) \right)$$

Light relics decoupling when thermalised with the primordial plasma

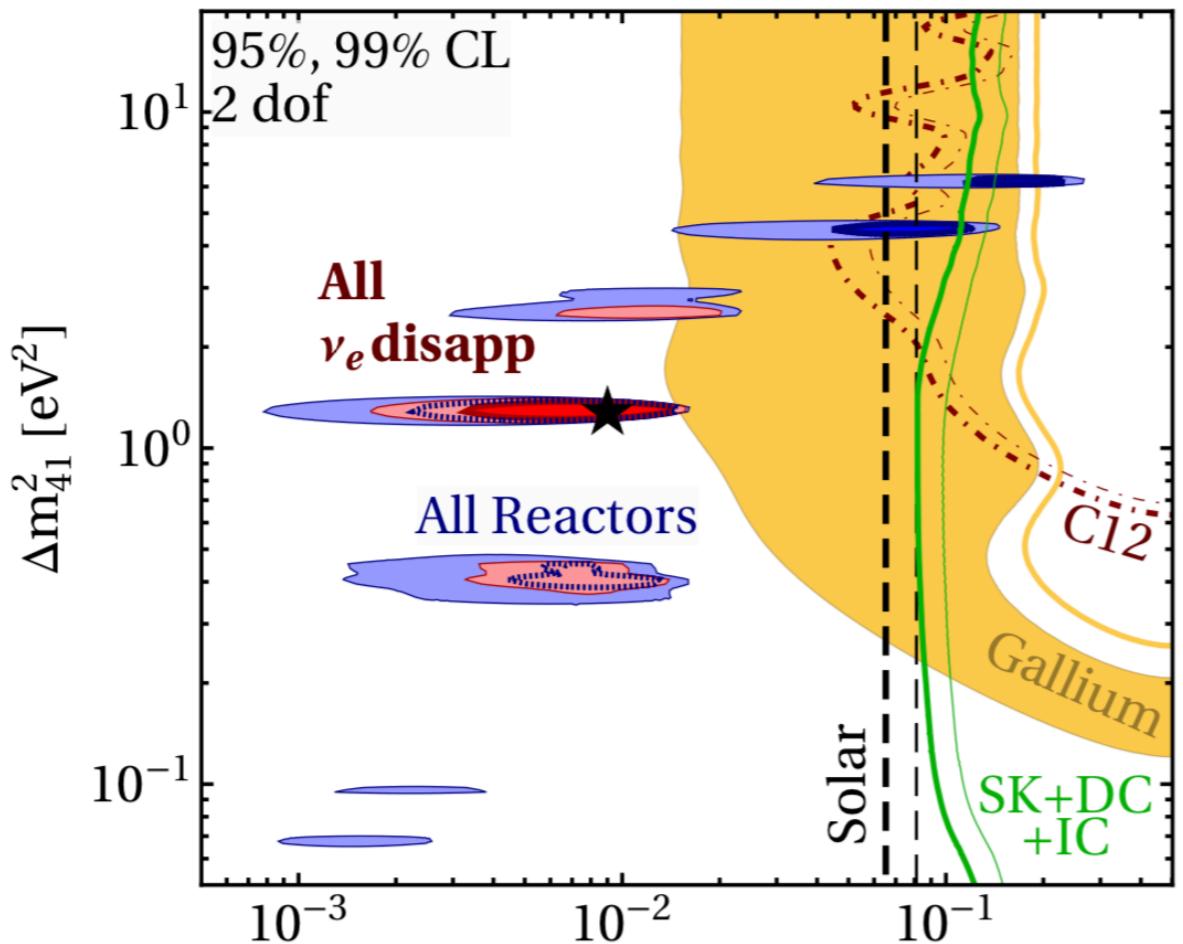

$$\Delta N_{\text{eff}} = g \left(\frac{43}{4g_{*,s}} \right)^{\frac{4}{3}} \times \begin{cases} 1/2, & \text{fermion} \\ 4/7, & \text{boson} \end{cases}$$

Effective dof at decoupling

Light sterile in cosmology

Dentler+, 2018

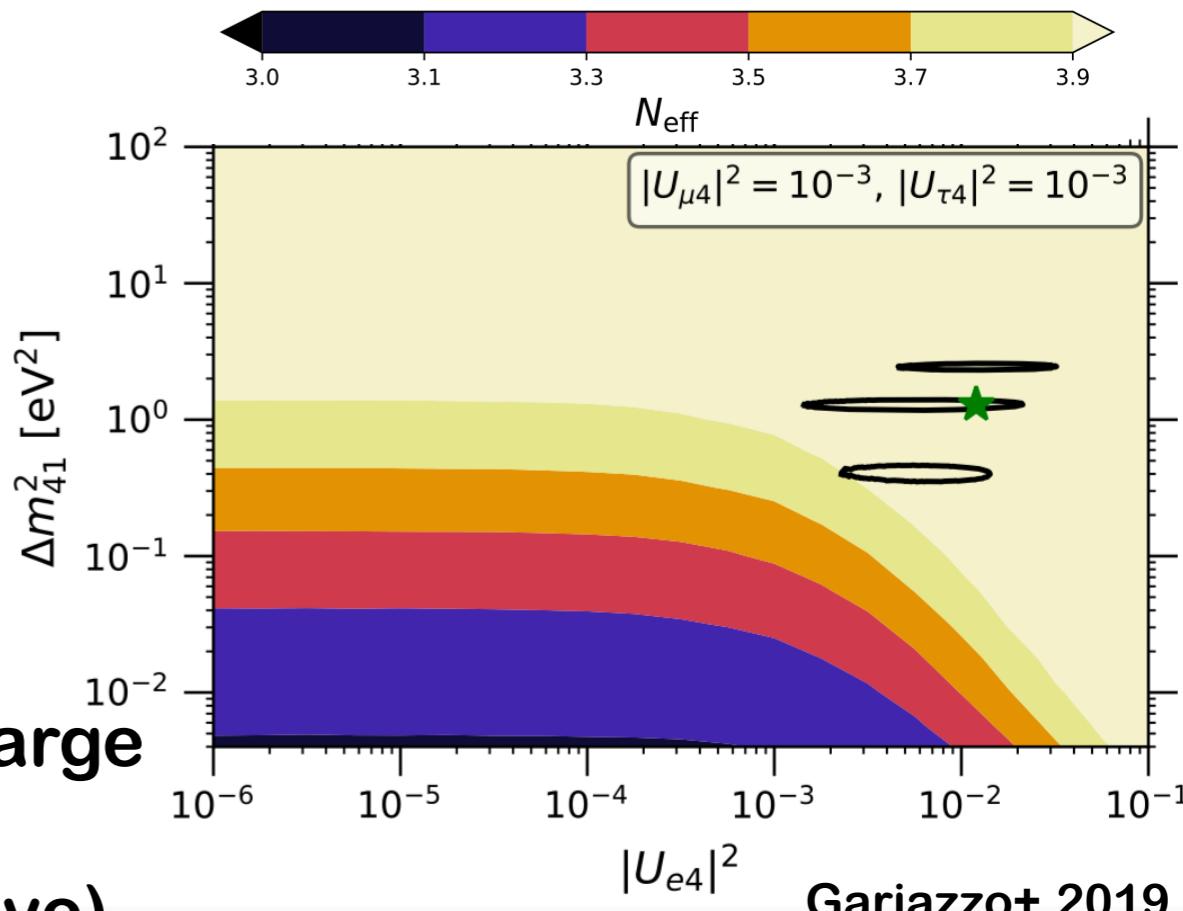

$$\begin{array}{c} \theta \\ \Delta m^2 \end{array} \xrightarrow{\text{red arrow}} \boxed{\Delta N_{\text{eff}}} \quad \Omega_{\nu,s} h^2 = \frac{m_{\text{eff}}}{94 \text{ eV}}$$

Lab best fit is at odds with cosmology: too large contribution to Neff for large mixing angles (quick thermalisation of the sterile with active)

Anomalies in oscillations would require light sterile with large mixing angle.

If they exist, oscillations in the early Universe would create a population of sterile

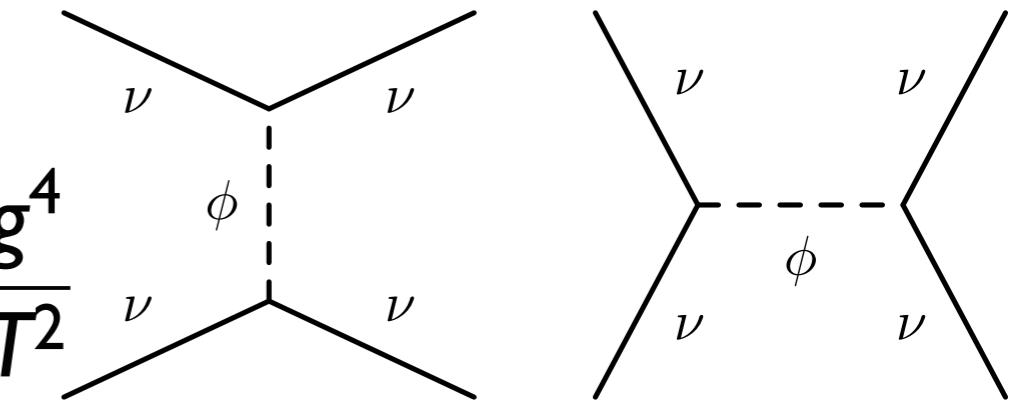

Gariazzo+, 2019

Scalar-mediated neutrino interactions

$$\mathcal{L} \supset h_{ij}\bar{\nu}_i\nu_j\phi + g_{ij}\bar{\nu}_i\gamma_5\nu_j\phi + h.c.,$$

$$\Gamma_{\nu\nu} = \langle\sigma v\rangle n_{\text{eq}} \propto g^4 T \quad \sigma \sim \frac{g^4}{s} \sim \frac{g^4}{T^2}$$

Collisional processes can suppress stress and affect the perturbation evolution of cosmological neutrinos.

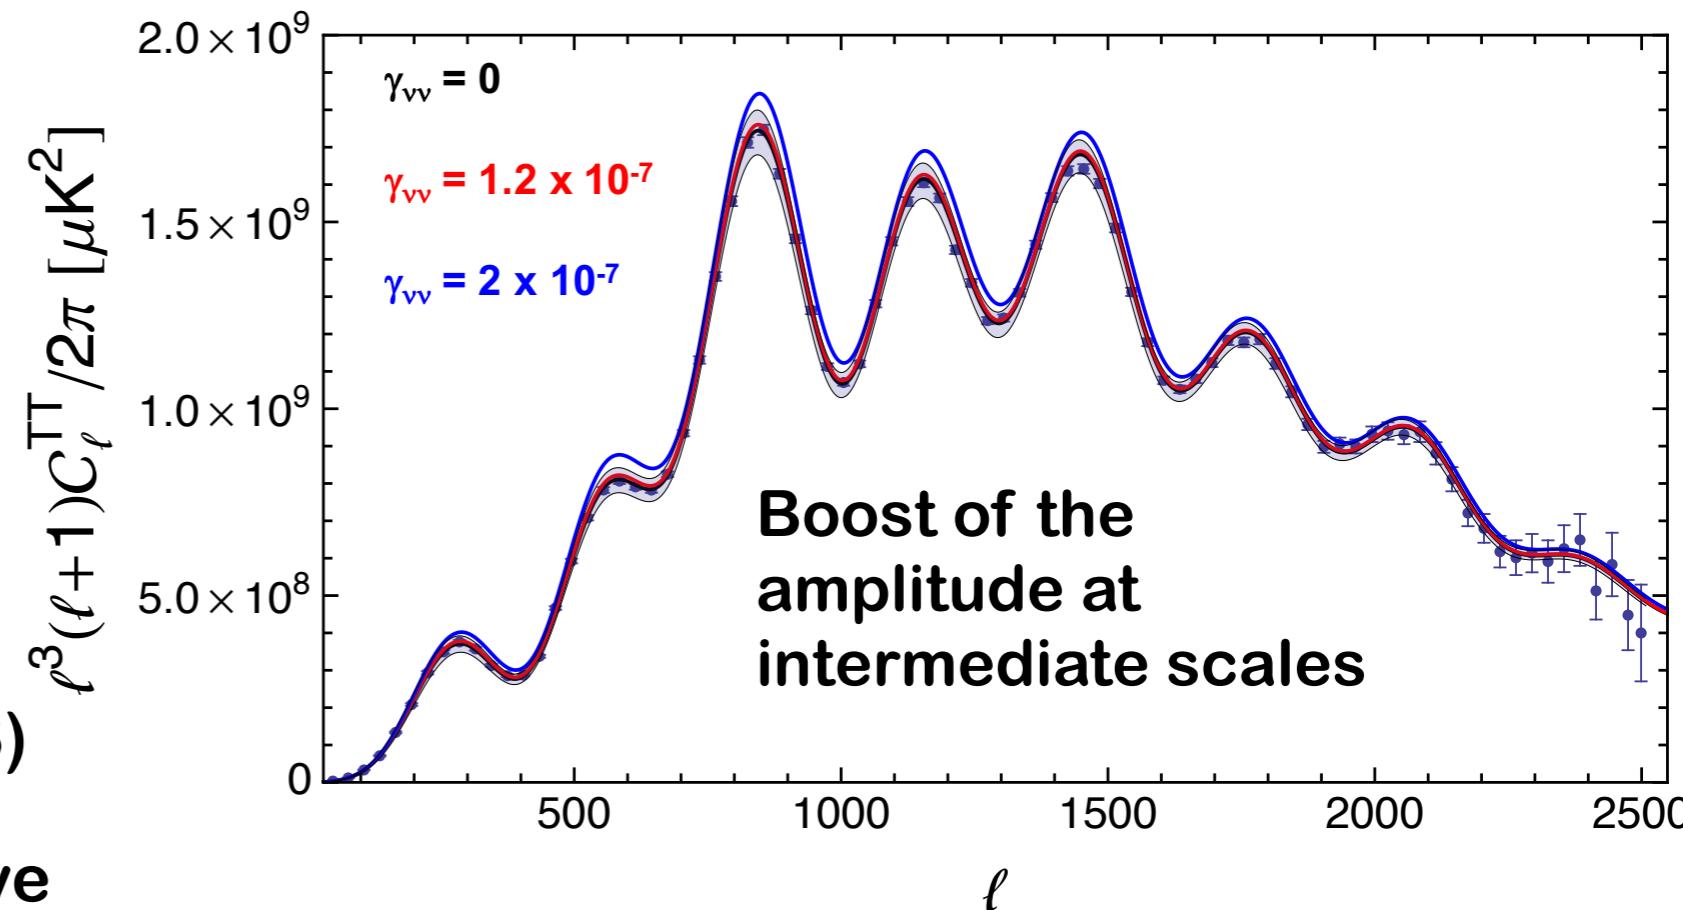

Parameterizing the interaction strength through:

$$\Gamma_{\nu\nu} \equiv \gamma_{\nu\nu}^4 T$$

Planck constraints (95% CL):

$$\gamma_{\nu\nu}^4 < (0.3 \div 0.5) \times 10^{-27}$$

i.e. $\gamma_{\nu\nu} \lesssim 10^{-7}$ (Forastieri+2018)

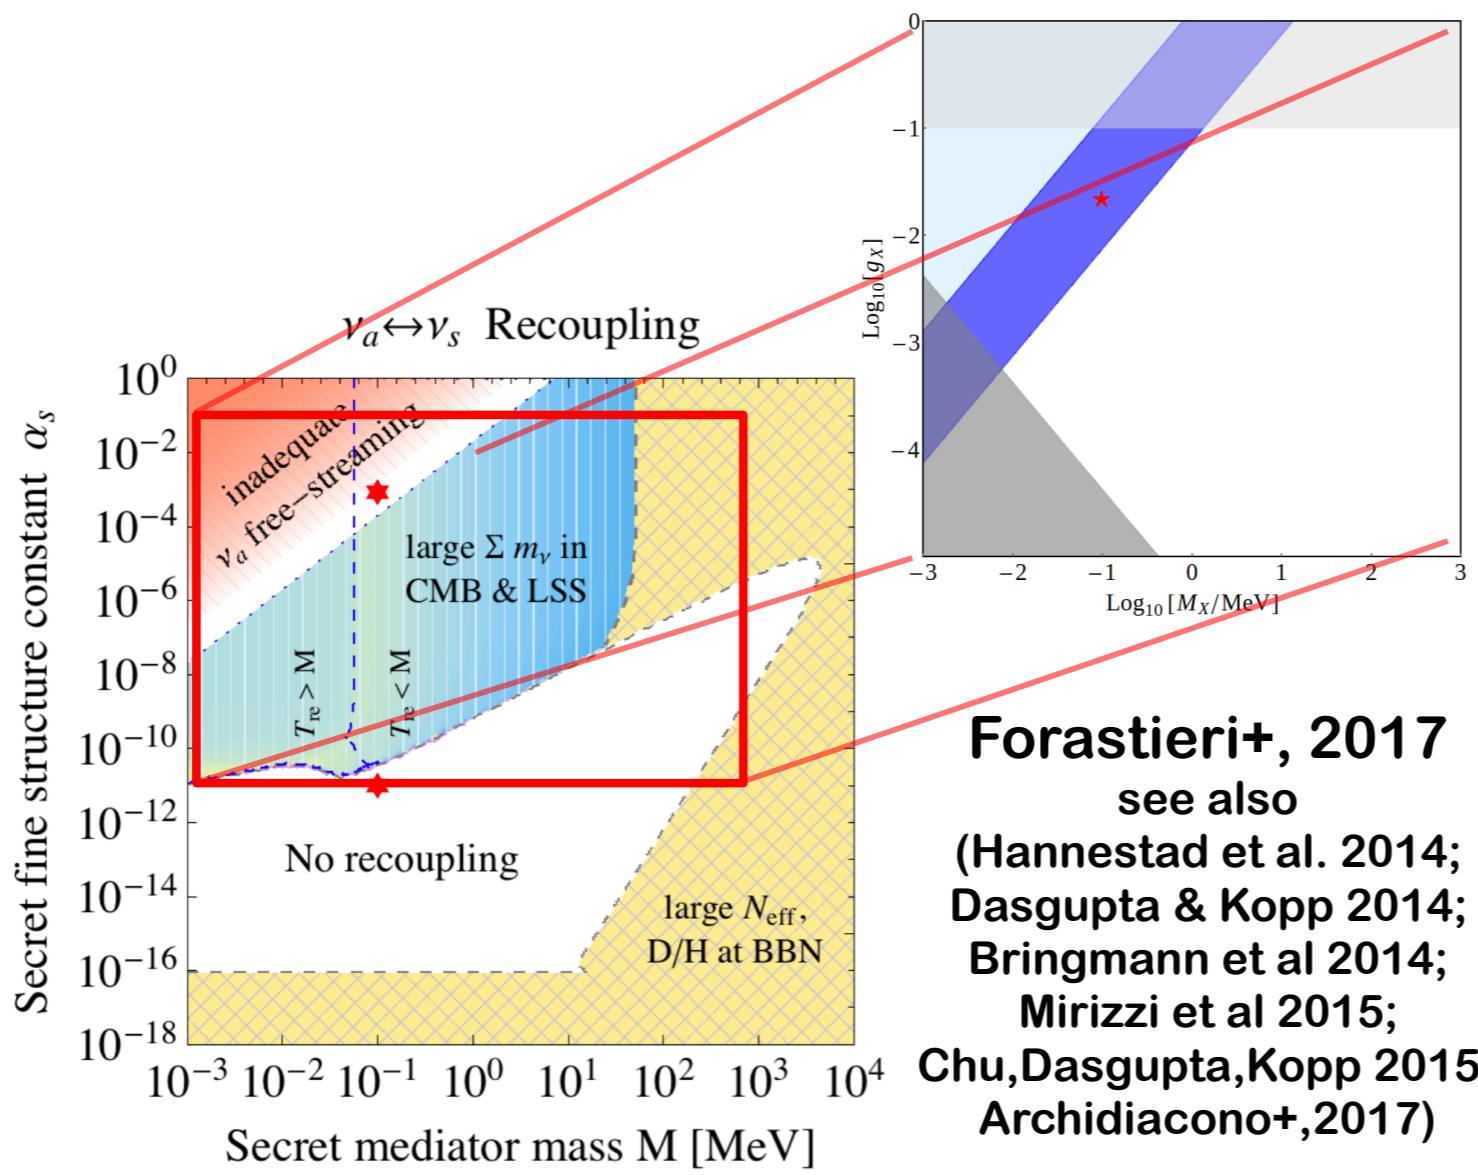

Forastieri+ 2015; Archidiacono & Hannestad 2013; Cyr-Racine & Sigurdson 2013

Sterile neutrino interactions and SBL anomalies

Sterile neutrino interpretation of SBL is in disagreement with cosmology (implies $\Delta N_{\text{eff}}=1$)

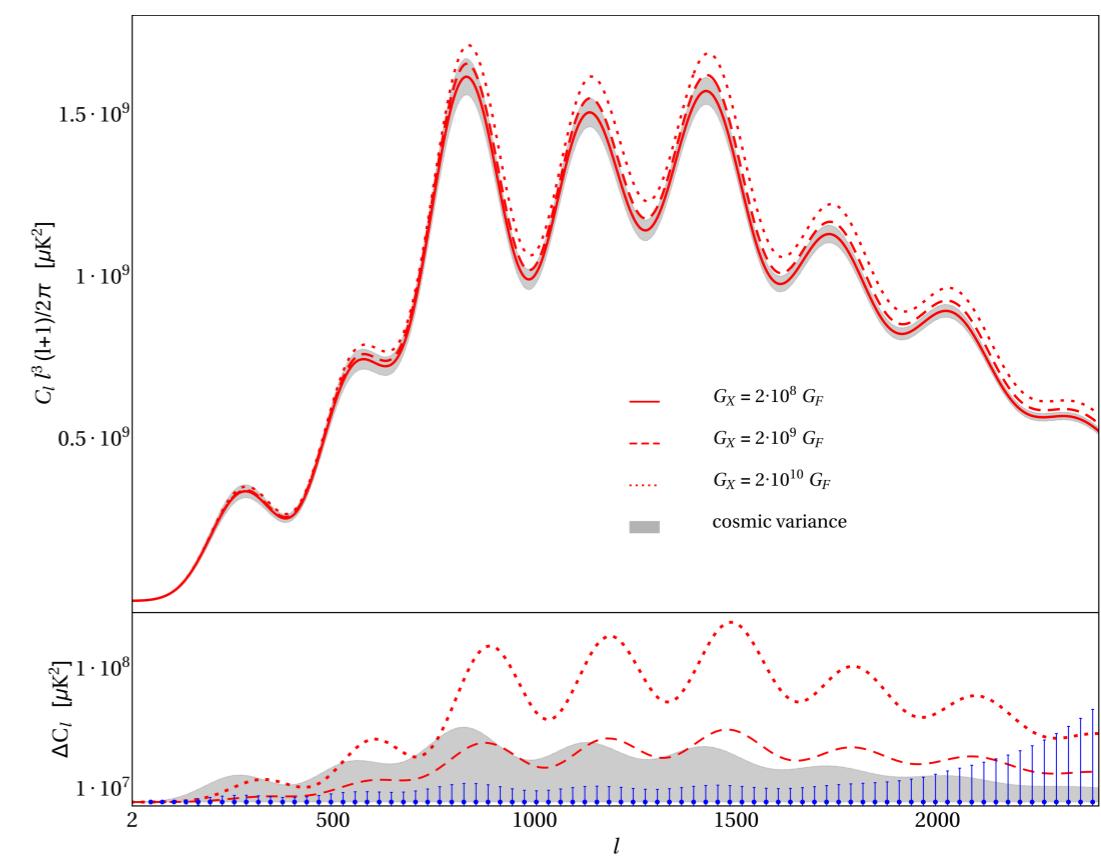

Are “Secret” interactions in the sterile sector a way out?

Production of sterile neutrinos is delayed, but large values of G_X will leave an observational signature on the CMB spectrum.

$$\mathcal{L}_s = g_X \bar{\nu}_s \gamma_\mu \frac{1}{2} (1 - \gamma_5) \nu_s X^\mu$$

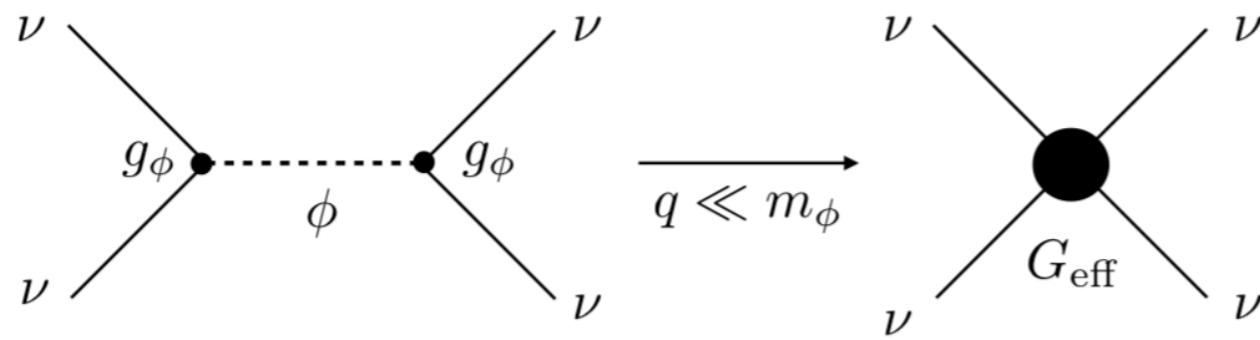

$$G_X \sim g_X^2 / M_X^2$$

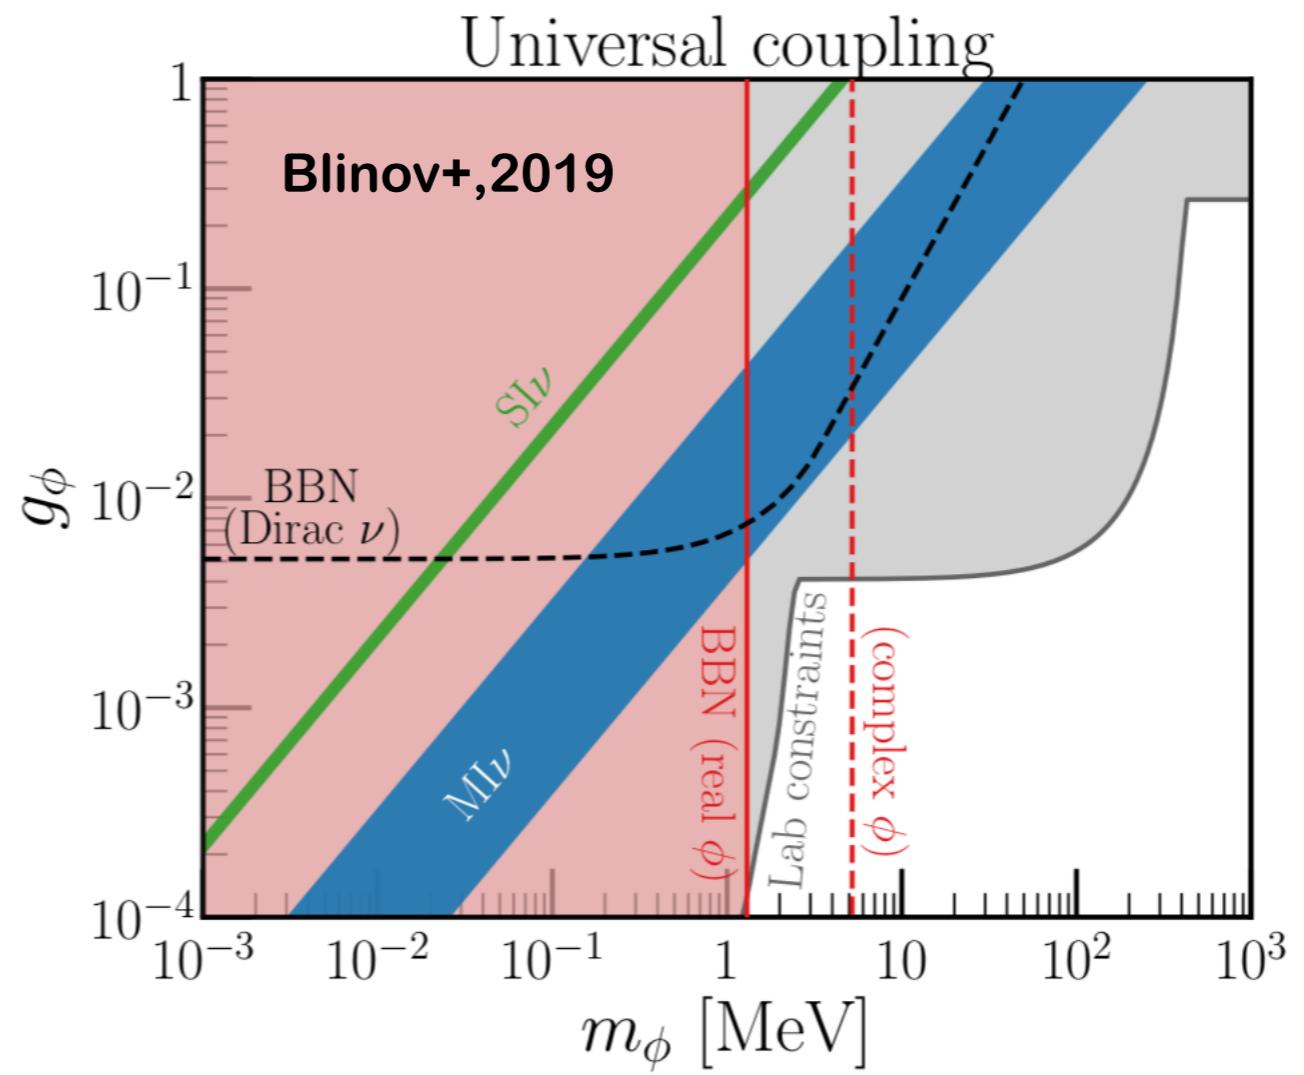

Scalar-mediated neutrino interactions

HEAVY MEDIATOR ($m_\phi > \text{keV}$)

Parameterizing the universal coupling $g_{ij} = g_\nu \delta_{ij}$ as
 $G_{\text{eff}} = g_\nu^2 / m_\phi^2$

Mildly interacting ->
 $G_{\text{eff}} < 10^{-4} \text{ MeV}^{-2}$
Strongly interacting ->
 $10^{-2} \text{ MeV}^{-2} < G_{\text{eff}} < 10^{-1} \text{ MeV}^{-2}$

Route to improved bounds on Neff
