CONCLUSION
AND OUTLOOK

- **T-duality** provides a powerful tool for investigating the structure of the spacetime from the string point of view by relating, in the usual σ -model approach, backgrounds which otherwise would be considered different.
- On a d -torus T^d , with constant backgrounds G_{ab} and B_{ab} , (Abelian) T-duality is described by $O(d, d; \mathbb{Z})$ transformations.
- By exchanging momentum and winding modes, it implies that the short distance behavior is governed by long distance behavior in the dual torus \tilde{T}^d .

CONCLUSION
AND OUTLOOK

- In terms of A_P the constraints

$$G_{ab}(\dot{X}^a \dot{X}^b + X'^a X'^b) = 0 \quad ; \quad G_{ab} \dot{X}^a X'^b = 0$$

become $A_P^t \mathcal{H} A_P = 0$ $A_P^t \eta A_P = 0$.

- The first sets H to zero ; the second completely determines the dynamics, rewritten in terms of the $O(d, d)$ invariant metric:

$$\eta = \begin{pmatrix} 0 & \mathbf{1} \\ \mathbf{1} & 0 \end{pmatrix}.$$

- The generalized metric is an element of $O(d, d)$: $\mathcal{H}^t \eta \mathcal{H} = \eta$
- All the admissible generalized vectors satisfying $A_P^t \eta A_P = 0$ are related by an $O(d, d)$ transformation via $A'_P = \mathcal{T} A_P$.
- For A'_P to solve the first constraint, a compensating transformation \mathcal{T}^{-1} has to be applied to \mathcal{H} , i.e.
 $\mathcal{H}' = (\mathcal{T}^{-1})^t \mathcal{H} (\mathcal{T}^{-1})$.

- \mathcal{H} and its inverse \mathcal{H}^{-1} can be rewritten in products:

$$\mathcal{H}(G, B) = \begin{pmatrix} 1 & B \\ 0 & 1 \end{pmatrix} \begin{pmatrix} G & 0 \\ 0 & G^{-1} \end{pmatrix} \begin{pmatrix} 1 & 0 \\ -B & 1 \end{pmatrix}$$

$$\mathcal{H}^{-1}(G, B) = \begin{pmatrix} 1 & 0 \\ B & 1 \end{pmatrix} \begin{pmatrix} G^{-1} & 0 \\ 0 & G \end{pmatrix} \begin{pmatrix} 1 & -B \\ 0 & 1 \end{pmatrix}$$

- \mathcal{H} and its inverse \mathcal{H}^{-1} can be rewritten in products:

$$\mathcal{H}(G, B) = \begin{pmatrix} 1 & B \\ 0 & 1 \end{pmatrix} \begin{pmatrix} G & 0 \\ 0 & G^{-1} \end{pmatrix} \begin{pmatrix} 1 & 0 \\ -B & 1 \end{pmatrix}$$

$$\mathcal{H}^{-1}(G, B) = \begin{pmatrix} 1 & 0 \\ B & 1 \end{pmatrix} \begin{pmatrix} G^{-1} & 0 \\ 0 & G \end{pmatrix} \begin{pmatrix} 1 & -B \\ 0 & 1 \end{pmatrix}$$

- This indeed shows that the background B can be created from the G -background through a B -transformation.

AND OUTLOOK

- Are there similar aspects in more general settings, for instance, when target space is curved or non-compact and/or, in particular, for other kinds of T-dualities?
- Non-Abelian T-duality refers to the existence of a global Abelian isometry on the target space of one of the two σ -models and of a global non-Abelian isometry on the other [de la Ossa and Quevedo, 1992, Alvarez, Alvarez-Gaumé and Lozano, 1993 - M. Rocek and E. Verlinde, 1993]

AND OUTLOOK

- Are there similar aspects in more general settings, for instance, when target space is curved or non-compact and/or, in particular, for other kinds of T-dualities?
- Non-Abelian T-duality refers to the existence of a global Abelian isometry on the target space of one of the two σ -models and of a global non-Abelian isometry on the other [de la Ossa and Quevedo, 1992, Alvarez, Alvarez-Gaumé and Lozano, 1993 - M. Rocek and E. Verlinde, 1993]
- The notion of **non-abelian T-duality** is still lacking some of the key features of its Abelian counterpart. A canonical procedure is missing that would yield the original theory if one is given its non-Abelian dual.

- $SU(2)$ Principal Chiral Model: target space $SU(2)$ and source space $\mathbb{R}^{1,1}$ endowed with the metric $h_{\alpha\beta} = \text{diag}(-1, 1)$.
- Action written in terms of $g^{-1}dg$, the Lie algebra valued left-invariant one-forms with $g \in SU(2)$:

$$S = \frac{1}{4} \int_{\mathbb{R}^2} dt d\sigma \text{Tr} [(g^{-1}\partial_t g)^2 - (g^{-1}\partial_\sigma g)^2]$$

trace \rightarrow scalar product on the Lie algebra $\mathfrak{su}(2)$,
non-degenerate and invariant.

$$S = \frac{1}{2} \int_{\mathbb{R}^2} dt d\sigma (A^i \delta_{ij} A^j - J^i \delta_{ij} J^j)$$

currents A^i and J^i : $g^{-1}\partial_t g = 2A^i e_i$, $g^{-1}\partial_\sigma g = 2J^i e_i$, $e_i = \sigma_i/2$.

$$A^i = \text{Tr} [(g^{-1}\partial_t g)e_i] \quad J^i = \text{Tr} [(g^{-1}\partial_\sigma g)e_i]$$

- Equations of motion:

$$\partial_t A = \partial_\sigma J,$$

$$\partial_t J = \partial_\sigma A - [A, J]$$

→ integrability condition for the the existence of a $g \in SU(2)$ that allows the expression of the two currents A^i and J^i .

- Equations of motion:

$$\partial_t A = \partial_\sigma J,$$

$$\partial_t J = \partial_\sigma A - [A, J]$$

→ integrability condition for the the existence of a $g \in SU(2)$ that allows the expression of the two currents A^i and J^i .

- At fixed t , all g 's constant at infinity form an **infinite dimensional Lie group** $SU(2)(\mathbb{R}) \equiv \text{Map}(\mathbb{R}, SU(2))$, given by smooth maps $g : \sigma \in \mathbb{R} \rightarrow g(\sigma) \in SU(2)$.
- At fixed time, the currents J and A take values **in the Lie algebra** $\mathfrak{su}(2)(\mathbb{R})$ of the group $SU(2)(\mathbb{R})$.

CONCLUSION
AND OUTLOOK

- The target phase space is naturally given by $T^*SU(2)$ (Drinfel'd double).
- Topologically is the manifold $S^3 \times \mathbb{R}^3$.
- As a group, $T^*SU(2) \simeq SU(2) \ltimes \mathbb{R}^3$.
- As a Poisson manifold it is symplectomorphic to the group $SL(2, \mathbb{C})$ (same topology).
- $T^*SU(2)$ and $SL(2, \mathbb{C})$ are both Drinfel'd doubles of the group $SU(2)$. The former is said *classical double*.
- (J^i, l_i) conjugate variables with J configuration space coordinates and l left generalized momenta:

$$l_i = \frac{\delta L}{\delta (g^{-1} \partial_t g)^i} = \delta_{ij} (g^{-1} \partial_t g)^j = \delta_{ij} A^j .$$

- **Hamiltonian:**

$$H = \frac{1}{2} \int_{\mathbb{R}} d\sigma (l_i l_j \delta^{ij} + J^i J^j \delta_{ij}) = \frac{1}{2} \int_{\mathbb{R}} d\sigma l_i (\mathcal{H}_0^{-1})^{ij} l_j$$

$l_i = (l_i, J^i)$ components of the current 1-form on $T^*SU(2)$ and

$$(\mathcal{H}_0^{-1})^{ij} = \begin{pmatrix} \delta^{ij} & 0 \\ 0 & \delta_{ij} \end{pmatrix}$$

is a Riemannian metric on $T^*SU(2)$.

- The Hamiltonian description of the Principal Chiral Model on $SU(2)$ naturally involves the Riemannian *generalized metric* \mathcal{H}_0^{-1} on the cotangent bundle.

- The first-order Lagrangian, together with the canonical one-form and the symplectic form, allows to determine the equal-time Poisson brackets :

$$\{I_i(\sigma), I_j(\sigma')\} = \epsilon_{ij}{}^k I_k(\sigma) \delta(\sigma - \sigma')$$

$$\{I_i(\sigma), J^j(\sigma')\} = \epsilon_{ki}{}^j J^k(\sigma) \delta(\sigma - \sigma') - \delta_i^j \delta'(\sigma - \sigma')$$

$$\{J^i(\sigma), J^j(\sigma')\} = 0$$

- The first-order Lagrangian, together with the canonical one-form and the symplectic form, allows to determine the equal-time Poisson brackets :

$$\{I_i(\sigma), I_j(\sigma')\} = \epsilon_{ij}{}^k I_k(\sigma) \delta(\sigma - \sigma')$$

$$\{I_i(\sigma), J^j(\sigma')\} = \epsilon_{ki}{}^j J^k(\sigma) \delta(\sigma - \sigma') - \delta_i^j \delta'(\sigma - \sigma')$$

$$\{J^i(\sigma), J^j(\sigma')\} = 0$$

- The I 's generators of the Lie algebra $\mathfrak{su}(2)(\mathbb{R})$.
- The J 's span an Abelian algebra \mathfrak{a} .
- I and J span the infinite-dimensional current algebra $\mathfrak{c}_1 = \mathfrak{su}(2)(\mathbb{R}) \ltimes \mathfrak{a}$.

- Equations of motion:

$$\partial_t l_j(\sigma) = \{H, l_j(\sigma)\} = \partial_\sigma J^k \delta_{kj}(\sigma),$$

and

$$\partial_t J^j(\sigma) = \{H, J^j(\sigma)\} = \partial_\sigma l_k \delta^{kj}(\sigma) - \epsilon^{jl}{}_k l_l J^k(\sigma).$$

- It is possible to give an **equivalent description of the dynamics** in terms of a new one-parameter family of Poisson algebras [Rajeev, 1989] and modified Hamiltonians, with the currents playing a symmetric role.

- Equations of motion:

$$\partial_t l_j(\sigma) = \{H, l_j(\sigma)\} = \partial_\sigma J^k \delta_{kj}(\sigma),$$

and

$$\partial_t J^j(\sigma) = \{H, J^j(\sigma)\} = \partial_\sigma l_k \delta^{kj}(\sigma) - \epsilon^{jl}{}_k l_l J^k(\sigma).$$

- It is possible to give an **equivalent description of the dynamics** in terms of a new one-parameter family of Poisson algebras [Rajeev, 1989] and modified Hamiltonians, with the currents playing a symmetric role.
- **Deformed brackets by parameter τ** (imaginary):

$$\{l_i(\sigma), l_j(\sigma')\} = (1 - \tau^2) \epsilon_{ij}{}^k l_k(\sigma) \delta(\sigma - \sigma')$$

$$\{l_i(\sigma), J^j(\sigma')\} = (1 - \tau^2) (J^k(\sigma) \epsilon_{ki}{}^j \delta(\sigma - \sigma') - (1 - \tau^2)^2 \delta_i^j \delta'(\sigma - \sigma'))$$

$$\{J^i(\sigma), J^j(\sigma')\} = (1 - \tau^2) \tau^2 \epsilon^{ij}{}_k l_k(\sigma) \delta(\sigma - \sigma').$$
- **The new brackets correspond to the infinite-dimensional Lie algebra $\mathfrak{c}_2 \simeq \mathfrak{sl}(2, \mathbb{C})(\mathbb{R})$** isomorphic to the current algebra modelled on the Lorentz algebra $\mathfrak{sl}(2, \mathbb{C})$.

- Modified Hamiltonian:

$$H_\tau = \frac{1}{2(1-\tau^2)^2} \int_{\mathbb{R}} d\sigma (l_i l_j \delta^{ij} + J^i J^j \delta_{ij}).$$

- Modified Hamiltonian:

$$H_\tau = \frac{1}{2(1-\tau^2)^2} \int_{\mathbb{R}} d\sigma (l_i l_j \delta^{ij} + J^i J^j \delta_{ij}).$$

- The previous equations of motion remain unmodified.
- Alternative description of one and the same dynamics even considering deformed algebras of $SL(2, \mathbb{C})$.

- Modified Hamiltonian:

$$H_\tau = \frac{1}{2(1-\tau^2)^2} \int_{\mathbb{R}} d\sigma (l_i l_j \delta^{ij} + J^i J^j \delta_{ij}).$$

- The previous equations of motion remain unmodified.
- Alternative description of one and the same dynamics even considering deformed algebras of $SL(2, \mathbb{C})$.
- Rescale the fields according to:

$$\frac{l_i}{1-\tau^2} \rightarrow l_i \quad \frac{J^j}{1-\tau^2} \rightarrow J^j.$$

The rescaled Hamiltonian H_τ becomes identical to the undeformed one H , while the Poisson algebra acquires the form:

$$\begin{aligned} \{l_i(\sigma), l_j(\sigma')\} &= \epsilon_{ij}^k l_k(\sigma) \delta(\sigma - \sigma'), \\ \{l_i(\sigma), J^j(\sigma')\} &= J^k(\sigma) \epsilon_{ki}^j \delta(\sigma - \sigma') - \delta_i^j \delta'(\sigma - \sigma'), \\ \{J^i(\sigma), J^j(\sigma')\} &= \tau^2 \epsilon^{ij}_k l_k(\sigma) \delta(\sigma - \sigma'). \end{aligned}$$

- Introduce new generators showing the bi-algebra structure of $\mathfrak{sl}(2, \mathbb{C})(\mathbb{R})$.
- Keeping the generators of $\mathfrak{su}(2)(\mathbb{R})$ unmodified, consider the linear combination:

$$K^i(\sigma) = J^i(\sigma) - i\tau\epsilon^{li3}I_l(\sigma).$$

- Introduce new generators showing the bi-algebra structure of $\mathfrak{sl}(2, \mathbb{C})(\mathbb{R})$.
- Keeping the generators of $\mathfrak{su}(2)(\mathbb{R})$ unmodified, consider the linear combination:

$$K^i(\sigma) = J^i(\sigma) - i\tau\epsilon^{li3}I_l(\sigma).$$

- From the deformed Poisson brackets it is possible to derive the Poisson brackets of the new generators:

$$\{K^i(\sigma), K^j(\sigma')\} = i\tau f^{ij}{}_k K^k(\sigma') \delta(\sigma - \sigma')$$

together with

$$\{I_i(\sigma), I_j(\sigma')\} = \epsilon_{ij}{}^k I_k(\sigma) \delta(\sigma - \sigma')$$

$$\{I_i(\sigma), K^j(\sigma')\} = \left(K^k(\sigma') \epsilon_{ki}{}^j + i\tau f^{jk}{}_i I_k(\sigma') \right) \delta(\sigma - \sigma') - \delta_i^j \delta'(\sigma - \sigma')$$

- Introduce new generators showing the bi-algebra structure of $\mathfrak{sl}(2, \mathbb{C})(\mathbb{R})$.
- Keeping the generators of $\mathfrak{su}(2)(\mathbb{R})$ unmodified, consider the linear combination:

$$K^i(\sigma) = J^i(\sigma) - i\tau\epsilon^{li3}I_l(\sigma).$$

- From the deformed Poisson brackets it is possible to derive the Poisson brackets of the new generators:

$$\{K^i(\sigma), K^j(\sigma')\} = i\tau f^{ij}{}_k K^k(\sigma') \delta(\sigma - \sigma')$$

together with

$$\{I_i(\sigma), I_j(\sigma')\} = \epsilon_{ij}{}^k I_k(\sigma) \delta(\sigma - \sigma')$$

$$\{I_i(\sigma), K^j(\sigma')\} = \left(K^k(\sigma') \epsilon_{ki}{}^j + i\tau f^{jk}{}_i I_k(\sigma') \right) \delta(\sigma - \sigma') - \delta_i^j \delta'(\sigma - \sigma')$$

- The K 's span the $\mathfrak{sb}(2, \mathbb{C})(\mathbb{R})$ Lie algebra with structure constants $f^{ij}{}_k = \epsilon^{ijl} \epsilon_{l3k}$.

- Introduce new generators showing the bi-algebra structure of $\mathfrak{sl}(2, \mathbb{C})(\mathbb{R})$.
- Keeping the generators of $\mathfrak{su}(2)(\mathbb{R})$ unmodified, consider the linear combination:

$$K^i(\sigma) = J^i(\sigma) - i\tau\epsilon^{li3}I_l(\sigma).$$

- From the deformed Poisson brackets it is possible to derive the Poisson brackets of the new generators:

$$\{K^i(\sigma), K^j(\sigma')\} = i\tau f^{ij}{}_k K^k(\sigma') \delta(\sigma - \sigma')$$

together with

$$\{I_i(\sigma), I_j(\sigma')\} = \epsilon_{ij}{}^k I_k(\sigma) \delta(\sigma - \sigma')$$

$$\{I_i(\sigma), K^j(\sigma')\} = \left(K^k(\sigma') \epsilon_{ki}{}^j + i\tau f^{jk}{}_i I_k(\sigma') \right) \delta(\sigma - \sigma') - \delta_i^j \delta'(\sigma - \sigma')$$

- The K 's span the $\mathfrak{sb}(2, \mathbb{C})(\mathbb{R})$ Lie algebra with structure constants $f^{ij}{}_k = \epsilon^{ij}{}_k$.

- The Lie algebra $\mathfrak{c}_2 \equiv \mathfrak{sl}(2, \mathbb{C})(\mathbb{R})$ has been expressed as

$SL(2, \mathbb{C})$ AS A DRINFEL'D DOUBLE

- The Lie algebra $\mathfrak{sl}(2, \mathbb{C})$ is defined by the Lie brackets:

$$[e_i, e_j] = i\epsilon_{ij}^k e_k \quad [e_i, b_j] = i\epsilon_{ij}^k b_k \quad [b_i, b_j] = -i\epsilon_{ij}^k e_k.$$

with

$$e_1 = \frac{\sigma_1}{2}, \quad e_2 = \frac{\sigma_2}{2}, \quad e_3 = \frac{\sigma_3}{2} \quad \text{generators of } \mathfrak{su}(2)$$
$$b_i = ie_i, \quad i = 1, 2, 3$$

$SL(2, \mathbb{C})$ AS A DRINFEL'D DOUBLE

- The Lie algebra $\mathfrak{sl}(2, \mathbb{C})$ is defined by the Lie brackets:

$$[e_i, e_j] = i\epsilon_{ij}^k e_k \quad [e_i, b_j] = i\epsilon_{ij}^k b_k \quad [b_i, b_j] = -i\epsilon_{ij}^k e_k.$$

with

$$e_1 = \frac{\sigma_1}{2}, \quad e_2 = \frac{\sigma_2}{2}, \quad e_3 = \frac{\sigma_3}{2} \quad \text{generators of } \mathfrak{su}(2)$$
$$b_i = ie_i, \quad i = 1, 2, 3$$

- It is equipped with two non-degenerate invariant scalar products:

$$\langle u, v \rangle = 2\text{Im}(\text{Tr}(uv)) \quad \forall u, v \in \mathfrak{sl}(2, \mathbb{C})$$

$$(u, v) = 2\text{Re}(\text{Tr}(uv)) \quad \forall u, v \in \mathfrak{sl}(2, \mathbb{C}).$$

$SL(2, \mathbb{C})$ AS A DRINFEL'D DOUBLE

- The Lie algebra $\mathfrak{sl}(2, \mathbb{C})$ is defined by the Lie brackets:

$$[e_i, e_j] = i\epsilon_{ij}^k e_k \quad [e_i, b_j] = i\epsilon_{ij}^k b_k \quad [b_i, b_j] = -i\epsilon_{ij}^k e_k.$$

with

$$e_1 = \frac{\sigma_1}{2}, \quad e_2 = \frac{\sigma_2}{2}, \quad e_3 = \frac{\sigma_3}{2} \quad \text{generators of } \mathfrak{su}(2)$$
$$b_i = ie_i, \quad i = 1, 2, 3$$

- It is equipped with two non-degenerate invariant scalar products:

$$\langle u, v \rangle = 2\text{Im}(\text{Tr}(uv)) \quad \forall u, v \in \mathfrak{sl}(2, \mathbb{C})$$

$$(u, v) = 2\text{Re}(\text{Tr}(uv)) \quad \forall u, v \in \mathfrak{sl}(2, \mathbb{C}).$$

- $\langle u, v \rangle$ defines two maximally isotropic subalgebras

$$[e_i, e_j] = i\epsilon_{ij}^k e_k, \quad [\tilde{e}^i, e_j] = i\epsilon_{jk}^i \tilde{e}^k + ie_k f^{ki}_j, \quad [\tilde{e}^i, \tilde{e}^j] = if^{ij}_k \tilde{e}^k$$

spanned by $\{e_i\}$ and the linear combination $\tilde{e}^i = b_i - \epsilon_{ij3}e_j$.

$SL(2, \mathbb{C})$ AS A DRINFEL'D DOUBLE

- The Lie algebra $\mathfrak{sl}(2, \mathbb{C})$ is defined by the Lie brackets:

$$[e_i, e_j] = i\epsilon_{ij}^k e_k \quad [e_i, b_j] = i\epsilon_{ij}^k b_k \quad [b_i, b_j] = -i\epsilon_{ij}^k e_k.$$

with

DOUBLE

BORN
GEOMETRY

DUAL PRINCIPAL
CHIRAL MODELS

THE DOUBLED
PRINCIPAL
CHIRAL MODEL

CONCLUSION
AND OUTLOOK

- Each subalgebra acts on the other one non-trivially, by co-adjoint action:

$$[\tilde{e}^i, e_j] = i\epsilon^i{}_{jk}\tilde{e}^k + if^{ki}{}_j e_k$$

- $SU(2, \mathbb{C})$ is **Drinfel'd** double of $SU(2)$ and $SB(2, \mathbb{C})$ with polarization $\mathfrak{sl}(2, \mathbb{C}) = \mathfrak{su}(2) \bowtie \mathfrak{sb}(2, \mathbb{C})$ and $(\mathfrak{sl}(2, \mathbb{C}), \mathfrak{su}(2), \mathfrak{sb}(2, \mathbb{C}))$ is a **Manin triple**.
- $SU(2)$ and $SB(2, \mathbb{C})$ are then dual groups.

- *Doubled* notation:

$$e_I = \begin{pmatrix} e_i \\ \tilde{e}^i \end{pmatrix}, \quad e_i \in \mathfrak{su}(2), \quad \tilde{e}^i \in \mathfrak{sb}(2, \mathbb{C}).$$

The first scalar product then becomes:

$$(e_I, e_J) = \eta_{IJ} = \begin{pmatrix} 0 & \delta_i^j \\ \delta_j^i & 0 \end{pmatrix}$$

which is $O(3,3)$ invariant by construction. The second scalar product yields:

$$(e_I, e_J) = \begin{pmatrix} \delta_{ij} & \epsilon_{ip3} \delta^{pj} \\ \delta^{ip} \epsilon_{jp3} & \delta^{ij} - \epsilon^{ik3} \delta_{kl} \epsilon^{jl3} \end{pmatrix}.$$

- The splitting $\mathfrak{d} = C_+ \oplus C_-$ with C_+, C_- spanned by $\{e_i\}, \{b_i\}$ respectively, defines a positive definite metric \mathcal{H} on \mathfrak{d} via:

$$\mathcal{H} = (,)_{C_+} - (,)_{C_-}$$

satisfying

$$\mathcal{H}^T \eta \mathcal{H} = \eta$$

namely \mathcal{H} is a pseudo-orthogonal $O(3,3)$ metric.

- A whole family of models exists, described by the Hamiltonians labelled by the parameter τ in terms of $I_J = (I_j, K^j)$:

$$H_\tau = \frac{1}{2} \int_{\mathbb{R}} d\sigma I_L(\mathcal{H}_\tau^{-1})^{LM} I_M$$

with \mathcal{H}_τ^{-1} being the *Riemannian generalized metric*

$$\mathcal{H}_\tau^{-1} = \begin{pmatrix} h^{ij}(\tau) & i\tau \epsilon^{ip3} \delta_{pj} \\ i\tau \delta_{ip} \epsilon^{jp3} & \delta_{ij} \end{pmatrix}$$

where:

$$h^{ij}(\tau) = \delta^{ij} - \tau^2 \epsilon^{ia3} \delta_{ab} \epsilon^{jb3} .$$

- A whole family of models exists, described by the Hamiltonians labelled by the parameter τ in terms of $I_J = (I_j, K^j)$:

$$H_\tau = \frac{1}{2} \int_{\mathbb{R}} d\sigma I_L(\mathcal{H}_\tau^{-1})^{LM} I_M$$

with \mathcal{H}_τ^{-1} being the *Riemannian generalized metric*

$$\mathcal{H}_\tau^{-1} = \begin{pmatrix} h^{ij}(\tau) & i\tau \epsilon^{ip3} \delta_{pj} \\ i\tau \delta_{ip} \epsilon^{jp3} & \delta_{ij} \end{pmatrix}$$

where:

$$h^{ij}(\tau) = \delta^{ij} - \tau^2 \epsilon^{ia3} \delta_{ab} \epsilon^{jb3} .$$

- They are related (and indeed equivalent) to the standard $SU(2)$ chiral model by the $O(3,3)$ transformation $K^i(\sigma) = J^i(\sigma) - i\tau \epsilon^{li3} I_l(\sigma)$, symmetry of the dynamics because it maps solutions into solutions .

CONCLUSION
AND OUTLOOK

- The PCM, in the Hamiltonian formulation given by any H_τ is a Poisson-Lie sigma-model.
- Hamiltonian vector fields $X_{K^i} \cdot := \{\cdot, K^i\}$ associated to the coordinates functions K^i for $T^*SU(2)$, close a non-Abelian algebra according to the following:

$$[X_{K^i}, X_{K^j}] = X_{\{K^i, K^j\}} = i\tau f_k^{ij} X_{K^k}$$

because of the non-trivial Poisson bracket $\{K^i(\sigma), K^j(\sigma')\} = i\tau f_k^{ij} K^k(\sigma')\delta(\sigma - \sigma') \rightarrow$ the constant structures of the dual Lie algebra $\mathfrak{sb}(2, \mathbb{C})$ appear.

- A dual formulation of this property can be given in terms of the Hamiltonian vector fields associated with the currents l_i that close the Lie algebra $\mathfrak{su}(2)$.

- Two-parameter generalization in the Poisson algebra generated by l_i and K^i by adding another imaginary parameter α making the role of the subalgebras $\mathfrak{su}(2)(\mathbb{R})$ and $\mathfrak{sb}(2, \mathbb{C})(\mathbb{R})$ symmetric:

$$\begin{aligned}\{l_i(\sigma), l_j(\sigma')\} &= i\alpha \epsilon_{ij}{}^k l_k(\sigma) \delta(\sigma - \sigma') \\ \{K^i(\sigma), K^j(\sigma')\} &= i\tau f^i{}_{jk} K^k(\sigma') \delta(\sigma - \sigma')\end{aligned}$$

$$\{l_i(\sigma), K^j(\sigma')\} = \left(i\alpha K^k(\sigma') \epsilon_{ki}{}^j + i\tau f^{jk}{}_i l_k(\sigma') \right) \delta(\sigma - \sigma') - \delta_i^j \delta'(\sigma - \sigma')$$

- In the limit $i\tau \rightarrow 0$, it reproduces the semi-direct sum $\mathfrak{su}(2)(\mathbb{R}) \ltimes \mathfrak{a}$, while the limit $i\alpha \rightarrow 0$ yields $\mathfrak{sb}(2, \mathbb{C})(\mathbb{R}) \ltimes \mathfrak{a}$.
- For all non zero values of the two parameters, the algebra is isomorphic to $\mathfrak{sl}(2, \mathbb{C})$, and, by suitably rescaling the fields, one gets a two-parameter family of models, all equivalent to the PCM.

- The dynamics derived from this algebra is equivalent to the dynamics following from the original underformed algebra on $T^*SU(2)$ and the undeformed Hamiltonian, if the new Hamiltonian is considered:

$$H_{\tau\alpha} = \frac{1}{2} \int_{\mathbb{R}} d\sigma l_L(\mathcal{H}_{\tau,\alpha}^{-1})^{LM} l_M.$$

with

$$\mathcal{H}_{\tau,\alpha}^{-1} = \begin{pmatrix} \frac{h^{ij}(\tau)}{(i\alpha)^2} & i\tau\epsilon^{ip3}\delta_{pj} \\ i\tau\delta_{ip}\epsilon^{jp3} & (i\alpha)^2\delta_{ij} \end{pmatrix}$$

- The dynamics derived from this algebra is equivalent to the dynamics following from the original underformed algebra on $T^*SU(2)$ and the undeformed Hamiltonian, if the new Hamiltonian is considered:

$$H_{\tau,\alpha} = \frac{1}{2} \int_{\mathbb{R}} d\sigma l_L (\mathcal{H}_{\tau,\alpha}^{-1})^{LM} l_M.$$

with

$$\mathcal{H}_{\tau,\alpha}^{-1} = \begin{pmatrix} \frac{h^{ij}(\tau)}{(i\alpha)^2} & i\tau \epsilon^{ip3} \delta_{pj} \\ i\tau \delta_{ip} \epsilon^{jp3} & (i\alpha)^2 \delta_{ij} \end{pmatrix}$$

- Since the role of l and K is now symmetric, one can perform an $O(3,3)$ transformation which exchanges the momenta l_i with the fields K^i , thus obtaining a new two-parameter family of models, *dual* to the PCM.

- The $O(3,3)$ transformation

$$\tilde{K}(\sigma) = I(\sigma), \quad \tilde{I}(\sigma) = K(\sigma)$$

when applied to $H_{\tau\alpha}$ and to the corresponding Poisson algebra leads to a new family of models having target space configuration the group manifold of $SB(2, C)$ spanned by the fields \tilde{K}_i and momenta \tilde{I}^i . These are the *Dual Principal Chiral Models*.

- The $O(3,3)$ transformation

$$\tilde{K}(\sigma) = I(\sigma), \quad \tilde{I}(\sigma) = K(\sigma)$$

when applied to $H_{\tau\alpha}$ and to the corresponding Poisson algebra leads to a new family of models having target space configuration the group manifold of $SB(2, C)$ spanned by the fields \tilde{K}_i and momenta \tilde{I}^i . These are the *Dual Principal Chiral Models*.

- The Dual Principal Chiral Models are Poisson-Lie sigma models.

- Lagrangian for the PCM $SB(2, \mathbb{C})$ involving $\tilde{g} : (t, \sigma) \rightarrow SB(2, \mathbb{C})$, one-forms valued in the Lie algebra $\mathfrak{sb}(2, \mathbb{C})$ and $\mathcal{T}r$ non-degenerate product only invariant under $SB(2, \mathbb{C})$ action:

$$\tilde{S} = \frac{1}{2} \int_{\mathbb{R}^{1,1}} \mathcal{T}r [\phi^*(\tilde{g}^{-1}d\tilde{g}) \wedge \phi^*(\tilde{g}^{-1}d\tilde{g})]$$

with $\tilde{\phi}^*(\tilde{g}^{-1}d\tilde{g}) = (\tilde{g}^{-1}\partial_t\tilde{g})_i \tilde{e}^i dt + (\tilde{g}^{-1}\partial_\sigma\tilde{g})_i \tilde{e}^i d\sigma$

$$\tilde{A}_i = (\tilde{g}^{-1}\partial_t\tilde{g})_i \quad , \quad \tilde{J}_i = (\tilde{g}^{-1}\partial_\sigma\tilde{g})_i$$

The Lagrangian becomes then:

$$\tilde{L} = \frac{1}{2} \int_{\mathbb{R}} d\sigma (\tilde{A}_i h^{ij} \tilde{A}_j - \tilde{J}_i h^{ij} \tilde{J}_k)$$

- At fixed t , all elements \tilde{g} constant at the infinity form the infinite-dimensional Lie group $SB(2, \mathbb{C})(\mathbb{R}) \equiv \text{Map}(\mathbb{R}, SB(2, \mathbb{C}))$, given by smooth maps $\tilde{g} : \sigma \in \mathbb{R} \rightarrow \tilde{g}(\sigma) \in SB(2, \mathbb{C})$ which are constant at infinity.

CONCLUSION
AND OUTLOOK

- By introducing left momenta $\tilde{l}^i = \tilde{A}_j h^{ij}$ and inverting for the generalized velocities, one obtains the Hamiltonian:

$$\tilde{H} = \frac{1}{2} \int_{\mathbb{R}} d\sigma \tilde{l}_I (\tilde{\mathcal{K}}_0^{-1})^{IJ} \tilde{l}_J$$

with

$$\tilde{\mathcal{K}}_0 = \begin{pmatrix} h^{ij} & 0 \\ 0 & h_{ij} \end{pmatrix}$$

and $\tilde{l}_J = (\tilde{l}^j, \tilde{J}_j)$.

- Equal-time Poisson brackets

$$\{\tilde{l}^i(\sigma), \tilde{l}^j(\sigma')\} = f^{ij}{}_k \tilde{l}^k(\sigma) \delta(\sigma - \sigma'),$$

$$\{\tilde{l}^i(\sigma), \tilde{J}_j(\sigma')\} = \tilde{J}_k(\sigma) f^{ki}{}_j \delta(\sigma - \sigma') - \delta_j^i \delta'(\sigma - \sigma'),$$

$$\{\tilde{J}_i(\sigma), \tilde{J}_j(\sigma')\} = 0$$

- Dual Born geometry.

AND OUTLOOK

- The Lagrangian density can be rewritten in terms of the left generalized coordinates $\dot{\mathbf{Q}}^I$ as follows:

$$\mathbf{L} = \frac{1}{2} (k \eta + \mathcal{H})_{IJ} \left(\dot{\mathbf{Q}}^I \dot{\mathbf{Q}}^J - \mathbf{Q}^I \mathbf{Q}^J \right)$$

with

$$(k\eta + \mathcal{H})_{IJ} = \begin{pmatrix} \delta_{ij} & k\delta_i^j + \epsilon_i^{j3} \\ k\delta_j^i - \epsilon_{j3}^i & (\delta^{jj} + \epsilon_{k3}^i \epsilon_{l3}^j \delta^{kl}) \end{pmatrix}$$

- η (Lorentzian) and \mathcal{H} (Riemannian) are the left-invariant metrics on $SL(2, \mathbb{C})$ induced, respectively, by the pairings $2\text{ImTr}()$ and $2\text{ReTr}()$ on $\mathfrak{sl}(2, \mathbb{C})$. They are two of the structures defining a Born geometry on $SL(2, \mathbb{C})$.
- The degrees of freedom are doubled. Performing a gauging of its global symmetries both the Lagrangian models, with $SU(2)$ and $SB(2, C)$ target configuration spaces, can be retrieved.
