Scenarios

Matrix Theory

Matrix Theory  
Cosmology

Conclusions

- **Inflationary Scenario** is the **current paradigm** of **early Universe cosmology**.
- Inflation is usually analyzed using an **effective field theory (EFT)** framework.
- **Fundamental conceptual problems** for an **EFT** description of a rapidly expanding universe.
- **Unitarity problem, inconsistency with the 2nd law of thermodynamics.**
- We need to look beyond an EFT description of the early universe!
- **Matrix Theory Cosmology**: Emergent metric space-time and early universe from the **BFSS** matrix model.

# Effective Field Theory (EFT) and the CC Problem

Emergent

R. Branden-  
berger

TCC

Scenarios

Matrix Theory

Matrix Theory  
Cosmology

Conclusions

- EFT: expand **fields** in comoving Fourier space.
- Quantize each Fourier mode like a harmonic oscillator → ground state energy.
- Add up ground state energies → CC problem.
- The usual quantum view of the CC problem is an artefact of an EFT analysis!

# Effective Field Theory (EFT) and the CC Problem

Emergent

R. Branden-  
berger

TCC

Scenarios

Matrix Theory

Matrix Theory  
Cosmology

Conclusions

- EFT: expand **fields** in comoving Fourier space.
- Quantize each Fourier mode like a harmonic oscillator  
→ ground state energy.
- Add up ground state energies → CC problem.
- The usual quantum view of the CC problem is an artefact of an EFT analysis!

# Application of the Second Law of Thermodynamics

S. Brahma, O. Alaryani and RB, arXiv:2005.09688

Emergent

R. Branden-  
berger

TCC

Scenarios

Matrix Theory

Matrix Theory  
Cosmology

Conclusions

- Consider **entanglement entropy density**  $s_E(t)$  between sub- and super-Hubble modes.
- Consider an **phase of inflationary expansion**.
- $s_E(t)$  increases in time since the phase space of super-Hubble modes grows.
- **Demand:**  $s_E(t)$  remain smaller than the post-inflationary thermal entropy.
- → Duration of inflation is bounded from above, consistent with the TCC.

# Application to EFT Description of Inflation

A. Bedroya, R.B., M. Loverde and C. Vafa., arXiv:1909.11106

Emergent

R. Brandenberger

TCC

Scenarios

Matrix Theory

Matrix Theory

# Application to EFT Descriptions of Inflation

A. Bedroya, R.B., M. Loverde and C. Vafa., arXiv:1909.11106

Emergent

R. Brandenberger

TCC

Scenarios

Matrix Theory

Matrix Theory  
Cosmology

Conclusions

TCC implies:

$$\frac{a(t_R)}{a(t_*)} |_{pl} < H(t_R)^{-1}$$

Demanding that inflation yields a causal mechanism for generating CMB anisotropies implies:

$$H_0^{-1} \frac{a(t_0)}{a(t_R)} \frac{a(t_R)}{a(t_*)} < H^{-1}(t_*)$$

# Implications

Emergent

R. Branden-  
berger

TCC

Scenarios

Matrix Theory

Matrix Theory  
Cosmology

Conclusions

**Upper bound** on the **energy scale of inflation**:

$$V^{1/4} < 3 \times 10^9 \text{GeV}$$

→ **upper bound** on the **primordial tensor to scalar ratio**  $r$ :

$$r < 10^{-30}$$

Note: Secondary tensors will be larger than the primary ones.

# Implications for Dark Energy

SMALL-SCALE FLUCTUATIONS OF RELIC RADIATION

9

Fig. 1a. Diagram of gravitational instability in the 'big-bang' model. The region of instability is located to the right of the line  $M_J(t)$ ; the region of stability to the left. The two additional lines of the graph demonstrate the temporal evolution of density perturbations of matter: growth until the moment when the considered mass is smaller than the Jeans mass and oscillations thereafter. It is apparent that at the moment of recombination perturbations corresponding to different masses correspond to different phases.

# Predictions from 1970

R. Sunyaev and Y. Zel'dovich, *Astrophys. and Space Science* **7**, 3 (1970); P. Peebles and J. Yu, *Ap. J.* **162**, 815 (1970).

Emergent

R. Brandenberger

TCC

Scenarios

Matrix Theory

Matrix Theory  
Cosmology

Conclusions

- Given a **scale-invariant power spectrum of adiabatic fluctuations** on "super-horizon" scales before  $t_{eq}$ , i.e. standing waves.
- → "correct" power spectrum of galaxies.
- → **acoustic oscillations in CMB angular power spectrum.**
- → **baryon acoustic oscillations in matter power spectrum.**

# Criteria for a Successful Early Universe Scenario

Emergent

R. Branden-  
berger

TCC

Scenarios

Matrix Theory

Matrix Theory  
Cosmology

Conclusions

- **Horizon  $\gg$  Hubble radius** in order for the scenario to solve the “horizon problem” of Standard Big Bang Cosmology.
- Scales of cosmological interest today **originate inside the Hubble radius at early times** in order for a causal generation mechanism of fluctuations to be possible.
- Mechanism for producing a **scale-invariant spectrum of curvature fluctuations** on super-Hubble scales.

Scenarios

Matrix Theory

Matrix Theory  
Cosmology

Conclusions

**Starting point:** BFSS matrix model at high temperatures.

- BFSS model is a quantum mechanical model of 10  $N \times N$  Hermitean matrices.
- Note: no space!
- Note: no singularities!
- Note: BFSS matrix model is a proposed non-perturbative definition of M-theory: 10 dimensional superstring theory emerges in the  $N \rightarrow \infty$  limit.

# BFSS Model (bosonic sector)

Inserting into the perturbed Einstein equations yields

$$\langle |\Phi(k)|^2 \rangle = 16\pi^2 G^2 k^{-4} \langle \delta T^0_0(k) \delta T^0_0(k) \rangle,$$

$$\langle |h(k)|^2 \rangle = 16\pi^2 G^2 k^{-4} \langle \delta T^i_j(k) \delta T^i_j(k) \rangle.$$

## Power spectrum of cosmological fluctuations

$$\begin{aligned}
 P_{\Phi}(k) &= 8G^2 k^{-1} \langle |\delta\rho(k)|^2 \rangle \\
 &= 8G^2 k^2 \langle (\delta M)^2 \rangle_R \\
 &= 8G^2 k^{-4} \langle (\delta\rho)^2 \rangle_R \\
 &= 8G^2 \frac{T}{\ell_S^3} \frac{1}{1 - T/T_H}
 \end{aligned}$$

Key features:

- **scale-invariant** like for inflation
- **slight red tilt** like for inflation

## Power spectrum of cosmological fluctuations

Matrix Theory  
Cosmology

Conclusions

Consider action of the Type IIB string theory in Schild gauge

$$S_{\text{Schild}} = \int d^2\sigma \alpha \left[ \sqrt{g} \left( \frac{1}{4} \{X^\mu, X^\nu\} - \frac{i}{2} \bar{\psi} \Gamma^\mu \{X^\mu, \psi\} \right) + \beta \sqrt{g} \right].$$

$$\text{Partition function : } Z = \int \mathcal{D}\sqrt{g} \mathcal{D}X \mathcal{D}\psi e^{-S_{\text{Schild}}}.$$

$$\text{Correspondence : } \{, \} \rightarrow -i[, ]$$

$$\int d^2\sigma \sqrt{g} \rightarrow \text{Tr}$$

Obtain grand canonical partition function of IKKT model.

# Some Details

Starting point: finite temperature partition function:

$$Z(\beta) = \int \mathcal{D}A \mathcal{D}X_i e^{-S(\beta)}$$

Internal energy

$$E = -\frac{d}{d\beta} \ln Z(\beta)$$

$$E = -\frac{3}{4} \lambda^{-1} \frac{N}{\beta} \int_0^\beta dt \text{Tr}[X_i \cdot X_j]^2$$

Matsubara expansion:

$$X_i = \sum_n X_i^n e^{i(2\pi n/\beta)t}$$

Conclusions

- Derivative w.r.t.  $T \rightarrow$  density fluctuations: both terms contribute.
- Derivative w.r.t.  $R \rightarrow$  pressure fluctuations: only second term contributes.

Power spectrum  $P(k)$  of density fluctuations: ( $k = R^{-1}$ )

- First term dominates in the UV: Poisson spectrum.
- Second term dominated in the IR: Scale-invariant spectrum.

$$P(k) = 16\pi^2 G^2 \lambda^{4/3} N^2 \mathcal{O}(1) \sim (l_s m_{pl})^{-4}$$

using the scaling  $G^2 N^2 \lambda^{4/3} \sim (l_s m_{pl})^{-4}$ .
