# The QCD Axion Sum Rule

Workshop on Standard Model and Beyond

Corfu August 27- September 7 2023

#### Belén Gavela Univ. Autónoma de Madrid and IFT

sectors, Dark matter and Neutring

# Why axions or ALPs ?

# Axions and ALPs a

# are the tell-tale of hidden

# symmetries

# awaiting discovery

as they are (pseudo)Goldstone bosons

Many small unexplained SM parameters

# Hidden symmetries can explain small parameters

# If spontaneously broken: Goldstone bosons a

-> derivative couplings to SM particles

# (Pseudo)Goldstone Bosons appear in many BSM theories

\* e.g. Extra-dim Kaluza-Klein: 5d gauge field compactified to 4d The Wilson line around the circle is a GB, which behaves as an axion in 4d

- \* Majorons, for dynamical neutrino masses
- \* From string models
- \* The Higgs itself may be a pGB ! ("composite Higgs" models)
- \* Axions a that solve the strong CP problem, and ALPs (axion-like particles)

The strong CP problem: Why is the QCD θ parameter so small?

$$\mathcal{L}_{QCD} = G_{\mu\nu} G^{\mu\nu} + \Theta G_{\mu\nu} G^{\mu\nu}$$

where  $\widetilde{G}_{\mu\nu} = \epsilon_{\mu\nu\rho\sigma} G^{\rho\sigma}$ 

The strong CP problem: Why is the QCD θ parameter so small?

$$\mathcal{L}_{QCD} = G_{\mu\nu}G^{\mu\nu}G^{\mu\nu} + \Theta G_{\mu\nu}G^{\mu\nu}G^{\mu\nu}$$

$$\vec{E^2} \cdot \vec{B^2} \qquad \Theta \vec{E} \cdot \vec{B}$$
(CP even) (CP odd)

experimentally (neutron EDM):  $\overline{\theta} \leq 10^{-10}$ 

The strong CP problem: Why is the QCD θ parameter so small?

A dynamical  $U(1)_A$  solution ?

The strong CP problem: Why is the QCD θ parameter so small?

A dynamical  $U(1)_A$  solution  $\rightarrow$  the axion **a**  [Peccei+Quinn 77] [Weinberg, 78] [Wilczek, 78]

The strong CP problem: Why is the QCD θ parameter so small?

The strong CP problem: Why is the QCD θ parameter so small?

### If axions or ALPs are the dark matter of the universe

e.g. for  $m_a = 10^{-6} \text{ eV}$ , inside each cm<sup>-3</sup> there must be

# about one thousand million axions per cm<sup>-3</sup> !

 $m_a f_a = cte$ .

 $m_a f_a = cte$ .

ma

 $m_a f_a = cte$ .

 $m_a f_a = cte$ .

The value of the constant is determined by the strong gauge group

 $m_a f_a = cte$ .

# \* If the confining group is QCD:

$$V_{SM}(\frac{a}{f_{a}}) = -m_{\pi}^{2} f_{\pi}^{2} \sqrt{1 - \frac{4m_{u}m_{d}}{(m_{u} + m_{d})^{2}} \sin^{2}\left(\frac{a}{2f_{a}}\right)}$$

 $m_a f_a = cte.$ 

# \* If the confining group is QCD:

$$m_a^2 f_a^2 = m_\pi^2 f_\pi^2 \frac{m_u m_d}{(m_u + m_d)^2}$$

canonical QCD axion

 $m_a f_a = cte$ .

 $m_u m_d$ 

# \* If the confining group is QCD:

canonical QCD axion

$$m_{a}^{2}f_{a}^{2} = m_{\pi}^{2}f_{\pi}^{2} rac{m_{u}m_{d}}{(m_{u}+m_{d})^{2}}$$
  
QCD topological susceptibility =  $\chi 
m QCD$ 

 $m_a f_a = cte.$ 

# \* If the confining group is QCD:

 $m_a f_a = cte.$ 

# \* If the confining group is QCD:

## How come the QCD axion mass is NOT $\sim \Lambda_{QCD}$

Because two pseudo scalars couple to the QCD anomalous current :

## How come the QCD axion mass is NOT $\sim \Lambda_{QCD}$

Because two pseudo scalars couple to the QCD anomalous current :

QCD: 
$$m_a^2 f_a^2 = m_\pi^2 f_\pi^2 \frac{m_u m_d}{(m_u + m_d)^2}$$
  
 $10^{-5} < m_a < 10^{-2} \,\text{eV}$ ,  $10^9 < f_a < 10^{12} \,\text{GeV}$ 

Because of SN and hadronic data, if axions light enough to be emitted

"Invisible axion"

#### e.g. Casper electric

#### $\{m_a, 1/f_a\}$ : direct **a - gluon coupling**

# Intensely looked for experimentally...

 $\mathbf{y} \mathbf{a} \boldsymbol{\gamma}$ 

... and theoretically

# Intensely looked for experimentally...

#### **ALPs (axion-like particles) territory**

#### **ALPs (axion-like particles) territory**

#### **ALPs (axion-like particles) territory**

# **Axions and ALPs can explain Dark Matter**

within the blueish bands axions/ALPs would account for all the DM

# The field is **BLOOMING**

My task today: can ALPs be true axions ?(i.e. solve strong CP)

#### ALPs territory: can they be true axions ?

#### ALPs territory: can they be true axions ?

#### ALPs territory: can they be true axions?

but.....

# Let me revisit, and challenge,

# the standard QCD wisdom

# ``The QCD axion sum rule"

with Pablo Quilez and Maria Ramos, arXiv2305.15465

#### In "true axion" models (= which solve the strong CP problem):

 $\mathbf{m}_{a}\mathbf{f}_{a}$  = cte.

### PQ symmetry = a global U(1)<sub>A</sub> symmetry,

#### exact at classical level

# PQ symmetry = a global U(1)<sub>A</sub> symmetry,

#### exact at classical level

$$\mathcal{L}_{QCD} \supset \frac{a}{f_a} G_{\mu\nu} \widetilde{G}^{\mu\nu}$$

$$m_a^2 f_a^2 = m_\pi^2 f_\pi^2 \frac{m_u m_d}{(m_u + m_d)^2}$$

# PQ symmetry = a global U(1)<sub>A</sub> symmetry,

### exact at classical level

$$\mathcal{L}_{\text{QCD}} \supset \frac{a}{f_a} G_{\mu\nu} \widetilde{G}^{\mu\nu}$$
This connection  
assumes that  
 $a$  is a mass  
eigenstate  
$$m_a^2 f_a^2 = m_\pi^2 f_\pi^2 \frac{m_u m_d}{(m_u + m_d)^2}$$
Unoranted !

# PQ symmetry = a global U(1)<sub>A</sub> symmetry,

### exact at classical level

$$\begin{split} \mathcal{L}_{\text{QCD}} \supset \frac{a}{f_a} G_{\mu\nu} \widetilde{G}^{\mu\nu} & \qquad \text{to be more precise:} \\ \text{that it only mixes} \\ \text{with the } \eta', \text{ i.e.:} \\ \text{QCD eigenstate} \\ = \text{mass eigenstate} \\ \text{ungranted !} \end{split}$$

#### Remember:

In SM electroweak interactions families mix because

The weak interaction basis  $\neq$  the mass basis

(they are not simultaneously diagonal, unlike for QCD or QED)

In QCD-axion interactions, axions may mix because

The gluon interaction basis  $\neq$  the mass basis

(they are not necessarily simultaneously diagonal)

In QCD-axion interactions, axions may mix because

The gluon interaction basis  $\neq$  the mass basis

(they are not necessarily simultaneously diagonal)

### The axion field may not be the only singlet scalar in Nature. It may mix with other singlet scalars

As long as the total scalar potential has a PQ symmetry, the strong CP problem is solved

#### coupling to gluons

**Standard QCD axion:** 

$$\mathcal{L} = \frac{\alpha_s}{8\pi} \left( \frac{a_{G\tilde{G}}}{f_a} - \bar{\theta} \right) G\tilde{G}$$

$$\Rightarrow m_a^2 f_a^2 = \chi_{\text{QCD}} \simeq m_\pi^2 f_\pi^2 \frac{m_u m_d}{(m_u + m_d)^2}$$

#### Instead, we can have:

$$\begin{aligned} \mathcal{L} &= \frac{\alpha_s}{8\pi} \left( \frac{\hat{a}_{G\widetilde{G}}}{F} - \bar{\theta} \right) G\widetilde{G} - V'(\hat{a}_{G\widetilde{G}}, \dots, \hat{a}_N) \\ &\Rightarrow m_i^2 f_i^2 = \mathbf{g}_i \chi_{\text{QCD}} \quad \text{within QCD} \end{aligned}$$

$$& \text{distance to standard case (g=)}$$

Axion-exotic scalars mixing has appeared before in other constructions (clockwork, GUT, multiHiggs...)

Kim, Niles, Peloso 2005 Choi, Kim, Yun 2014 Kaplan, Ratazzi 2016 Giudice, McCullough 2017 Di Luzio et al. 2018 Fraser, Reece 2020 Darme et al. 2021 Chen at al. 2022 Agrawal Nee, Reig 2022

but, either by choice or by construction, they took the limit where all but one decouple

# Plan

# 1) A toy model with N=2 scalars

2) N fields and the most general PQ-invariant potential

$$\mathcal{L}_{N=2} = \left(\frac{a_{G\tilde{G}}}{F} + \theta\right) G\tilde{G} - V(a_{G\tilde{G}}, a_{\perp})$$
$$a_{\tilde{G}} \quad \hat{a}_{1}$$

or equivalently:

## Several exact results follow from the eigenvalue-eigenvector theorem

Jacobi.....

PETER B. DENTON, STEPHEN J. PARKE, TERENCE TAO, AND XINING ZHANG

ABSTRACT. If A is an  $n \times n$  Hermitian matrix with eigenvalues  $\lambda_1(A), \ldots, \lambda_n(A)$ and  $i, j = 1, \ldots, n$ , then the  $j^{\text{th}}$  component  $v_{i,j}$  of a unit eigenvector  $v_i$  associated to the eigenvalue  $\lambda_i(A)$  is related to the eigenvalues  $\lambda_1(M_j), \ldots, \lambda_{n-1}(M_j)$ of the minor  $M_j$  of A formed by removing the  $j^{\text{th}}$  row and column by the formula

$$|v_{i,j}|^2 \prod_{k=1; k \neq i}^n (\lambda_i(A) - \lambda_k(A)) = \prod_{k=1}^{n-1} (\lambda_i(A) - \lambda_k(M_j)) .$$

We refer to this identity as the *eigenvector-eigenvalue identity* 

https://arxiv.org/pdf/1908.03795.pdf

$$\mathcal{L} \supset \frac{\alpha_s}{8\pi} \frac{a_i}{f_i} G \widetilde{G} \qquad \text{with} \qquad \frac{1}{f_i} = \frac{\left\langle a_{G \widetilde{G}} | a_i \right\rangle}{F} \equiv \bigvee_{i=1}^{N} \frac{1}{f_i^2} = \frac{1}{F^2}$$

#### **Peccei-Quinn condition for arbitrary M**

$$\lim_{\chi_{\rm QCD}\to 0} \det \mathbf{M}^2 = 0 \implies \det \mathbf{M}_{\rm ext} = 0$$

$$\frac{1}{F^2} = \sum_{i=1}^N \frac{1}{\frac{f_i^2}{f_i^2}}$$

$$\frac{\det \mathbf{M}^2}{\det \mathbf{M}_1^2} = \frac{f_\pi^2 m_\pi^2}{F^2} \frac{m_u m_d}{(m_u + m_d)^2} \Big|^{\mathsf{P}}$$

Q-invariance condition for arbitrary potential

#### **Peccei-Quinn condition for arbitrary M**

$$\lim_{\chi_{\rm QCD}\to 0} \det \mathbf{M}^2 = 0 \implies \det \mathbf{M}_{\rm ext} = 0$$

$$\frac{1}{F^2} = \sum_{i=1}^{N} \frac{1}{\frac{f_i^2}{f_i^2}}$$

$$\frac{\det \mathbf{M}^2}{\det \mathbf{M}_1^2} = \frac{f_\pi^2 m_\pi^2}{F^2} \frac{m_u m_d}{\left(m_u + m_d\right)^2} \begin{bmatrix} \text{PQ-invariance} \\ \text{condition} \\ \text{for arbitrary} \\ \text{potential} \end{bmatrix}$$

Ξ

$$U(1)_{PQ} \implies \sum_{i=1}^{N} \frac{1}{g_i} = 1$$

or equivalently 
$$\exists U(1)_{PQ} \implies \sum_{i=1}^{N} \beta_i = 1; \quad \beta_i = \frac{1}{g_i}$$
  
 $QCD$ -axionness is shared

#### An intuitive view of the *QCD-axionness* $\beta_i \equiv$

$$|a_i\rangle$$
 : eigenstates

- $|a_{G\widetilde{G}}\rangle$  : field(s) that couple to  $G\widetilde{G}$
- $\mid a_{PQ}
  angle$  : field(s) that maintain shift invariance

then 
$$\beta_{i} = \frac{1}{g_{i}} = \frac{\langle a_{\mathrm{PQ}} \mid a_{i} \rangle \langle a_{i} \mid a_{G\widetilde{G}} \rangle}{\langle a_{\mathrm{PQ}} \mid a_{G\widetilde{G}} \rangle}$$

and it can be proven that:

$$1 = \frac{\left\langle a_{\mathrm{PQ}} \mid a_{G\widetilde{G}} \right\rangle}{\left\langle a_{\mathrm{PQ}} \mid a_{G\widetilde{G}} \right\rangle} = \sum_{i}^{N} \frac{\left\langle a_{\mathrm{PQ}} \mid a_{i} \right\rangle \left\langle a_{i} \mid a_{G\widetilde{G}} \right\rangle}{\left\langle a_{\mathrm{PQ}} \mid a_{G\widetilde{G}} \right\rangle} = \sum_{i}^{N} \frac{\chi_{\mathrm{QCD}}}{m_{i}^{2} f_{i}^{2}} = \sum_{i}^{N} \frac{1}{g_{i}}$$

$$\frac{1}{g_i}$$

#### Maxions (maximally deviated QCD axions):

$$\max\left\{\min_{i}\left\{g_{i}\right\}\right\} = N \implies g_{i} = N \quad \forall i$$

$$\mathrm{Tr}[\mathbf{M}^2] = \sum_i m_i^2 = N \frac{\chi_{\rm QCD}}{F^2}$$

## a simple KSVZ with 2 true QCD axions

 $\Psi_{1,2} \sim (3,1,0)$   $S_{1,2} \sim (1,1,0)$ 

 $\mathcal{L}_{\mathrm{UV}} = |\partial_{\mu}S_1|^2 + |\partial_{\mu}S_2|^2 + \overline{\Psi}_1 \mathbf{i} \not \!\!D \Psi_1 + \overline{\Psi}_2 \mathbf{i} \not \!\!D \Psi_2 - \left[y_1 \overline{\Psi}_1 \Psi_1 S_1 + y_2 \overline{\Psi}_2 \Psi_2 S_2 + \mathrm{h.c.}\right] - V(S_{1,2})$ 

$$S_i = rac{1}{\sqrt{2}} \left( \hat{f}_i + 
ho_i 
ight) e^{\mathrm{i}\hat{a}_i/\hat{f}_i}$$

for instance  $V(S_{1,2}) \sim S_2^4$ 

reduces the system to just one PQ

and gives precisely the first N=2 mass matrix I showed you !

## a simple KSVZ with 2 true QCD axions

 $\Psi_{1,2} \sim (3,1,0)$   $S_{1,2} \sim (1,1,0)$ 

 $\mathcal{L}_{\rm UV} = |\partial_{\mu}S_1|^2 + |\partial_{\mu}S_2|^2 + \overline{\Psi}_1 i D \Psi_1 + \overline{\Psi}_2 i D \Psi_2 - \left[y_1 \overline{\Psi}_1 \Psi_1 S_1 + y_2 \overline{\Psi}_2 \Psi_2 S_2 + \text{h.c.}\right] - V(S_{1,2})$ 

$$S_i = \frac{1}{\sqrt{2}} \left( \hat{f}_i + \rho_i \right) e^{\mathrm{i}\hat{a}_i / \hat{f}_i}$$

for instance  $V(S_{1,2}) = \lambda S_1^3 S_2 + \text{h.c.}$  reduces the system to just one PQ

$$V_{\text{eff}} = \frac{1}{2} \chi_{\text{QCD}} \left( \frac{\hat{a}_1 + \hat{a}_2}{\hat{f}} - \bar{\theta} \right)^2 + \frac{\lambda}{4} \hat{f}^4 \left( \frac{3\hat{a}_1 + \hat{a}_2}{\hat{f}} \right)^2$$
$$\left( \hat{f}_1 = \hat{f}_2 = \hat{f}_1 \right)$$

$$\mathbf{M}^{2} = \frac{\chi_{\text{QCD}}}{F^{2}} \begin{pmatrix} 2+8r & -4r \\ -4r & 2r \end{pmatrix} \qquad 1/F^{2} = 2/\hat{f}^{2}$$

 $\operatorname{Tr}[\mathbf{M}^2] = \sum m_i^2 = N \frac{\chi_{ ext{QCD}}}{F^2}$ 

Maxion solution for r=1/5 +

#### How far from $\Lambda_{QCD}$ must the new scales be to impact experiment?

Consider N=3 and an extra potential of the form:

and

$$\hat{\mathbf{M}}^2 = \frac{\chi_{\text{QCD}}}{\hat{f}^2} \begin{pmatrix} 1 & 1 & 1 \\ 1 & 1 + \tilde{\lambda}_1 & 1 \\ 1 & 1 & 1 + \tilde{\lambda}_2 \end{pmatrix}$$
  
and ratios of the other two scales :  $\tilde{\lambda}_1 = 10^{-3} \tilde{\lambda}_2 = 0.5$   
This would lead to:  $(q_1, q_2, q_3) \approx (1.2, 7.3, 497)$ 

o: 
$$(g_1, g_2, g_3) \approx (1.2, 7.3, 497)$$

-> Measuring g<sub>1</sub> and g<sub>2</sub> with enough precision would allow to infer the existence of a third axion even if  $1/g_3 \ll 1$ 

#### right ALP territory: they can be pure QCD axions

#### Conclusions

# \* The PQ solution to the strong CP problem leads in all generality to multiple QCD axion signals

-> displaced to the right of the canonical QCD band
 -> the usual single QCD axion is just one limit

- \* The smoking gun is the multiplicity of signals.
- \* Exact PQ invariance condition and exact PQ sum rule
- \* The main experimental impact is from scales not far from the QCD contribution
- \* Beautiful synergy between different experiments.

#### Conclusions / Outlook

It is a deep pleasure to be here today

Thank you very very much for the invitation!

### **Clockwork axions**

$$\hat{\mathbf{M}}^{2} = \frac{\chi_{\text{QCD}}}{\hat{f}^{2}} \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix} + r \frac{\chi_{\text{QCD}}}{\hat{f}^{2}} \begin{pmatrix} 1 & -q & 0 \\ -q & 1+q^{2} & -q \\ 0 & -q & q^{2} \end{pmatrix}$$

Certainly comply with the PQ condition: det  $M^2/\det M_1^2 = \chi_{QCD}/F^2$ 

#### but do not allow Maxion solutions:

e.g. q=1/3  

$$\operatorname{Tr} \mathbf{M}^{2} = N \, \frac{\chi_{\text{QCD}}}{F^{2}} \Leftrightarrow r = \frac{1}{10} ,$$

$$\operatorname{Tr}^{2} \mathbf{M}^{2} - \operatorname{Tr} \mathbf{M}^{2} \cdot \mathbf{M}^{2} = N \, \frac{\chi_{\text{QCD}}}{F^{2}} \operatorname{Tr} \mathbf{M}_{1}^{2} \Leftrightarrow r = 0 \lor r = \frac{11}{182}$$
Not compatible
