#### Leptonic sector

Lepton mass and flavour violation in Randall Sundrum Models

Abhishek M Iyer

Randall-Sundrum Model

Mass Models

Constraints from Flavour

Minimal Flavour Violation

- Leptonic sector in RS has been subject of intense study in the past Huber and Shafi '01-'04, Sundrum et al. '09,
- Offers numerous possibilities corresponding to Dirac or Majorana nature of neutrinos.
- Flavour consideration places very strict constraints on the model.

• Minimal RS incapable of satisfying mixing data and flavour constraints simulatneously. Mu-chun chen, Perez et al, Csaki

### Goal of the study

Lepton mass and flavour violation in Randall Sundrum Models

Abhishek M Iyer

Randall-Sundrum Model

Mass Models

Constraints from Flavour

Minimal Flavour Violation

- Shed light on the finer details of two most important quantities involved in fitting in leptonic sector:
  - a) c parameters and

b) $\mathcal{O}(1)$  Yukawa parameters, both of which are varied to arrive at the best fit region for the bulk mass parameters

- While the  $\mathcal{O}(1)$  Yukawa are varied in the interval [.08, 4], the c parameters should ideally lie in the interval [-1, 1]
- Constrain the parameter space by flavour considerations.

#### $\chi^2$ minimization

Lepton mass and flavour violation in Randall Sundrum Models

Abhishek M Iyer

Randall-Sundrum Model

Mass Models

Constraints from Flavour

Minimal Flavour Violation

- Fit the bulk RS parameters to the leptonic masses and mixing angles
- Results presented for normal hierarchy of neutrino masses.

- Perform the analysis for different models of neutrino masses
  - a) LHLH case
  - b) Dirac Case
  - c) Bulk 'Majorana' mass terms

#### Summary of LLHH case

Lepton mass and flavour violation in Randall Sundrum Models

Abhishek M Iyer

Randall-Sundrum Model

Mass Models

Dirac Neutrinos Bulk Majorana case

Constraints from Flavour

Minimal Flavour Violation Allowed range for the bulk parameters with minimum  $\chi^2$ . Neutrino masses have normal hierarchy. Range of first KK scale  $M^{(1)}$  corresponding to the bulk mass parameter is also given.

parameter	range	range of $M^{(1)}$ (TeV)
$c_{L_1}$	0.87-0.995	1.49-1.59
$c_{L_2}$	0.86-0.98	1.48-1.58
$c_{L_3}$	0.84-0.92	1.47-1.53
$c_{E_1}$	$-10.0$ - $-5.0 imes10^6$	$7.9 extrm{-}3.9 imes10^6$
$c_{E_2}$	$-1.0 imes10^4$ - $-1.2 imes10^8$	$7.9\times10^3\text{-}9.5\times10^7$
$c_{E_3}$	$-7.0  imes 10^{5}$ - $-1  imes 10^{9}$	$5.5\times10^5$ $7.9\times10^8$

#### Implications of large negative c parameters

Lepton mass and flavour violation in Randall Sundrum Models

Abhishek M Iyer

Randall-Sundrum Model

Mass Models

LLHH case

Dirac Neutrinos Bulk Majorana case

Constraints from Flavour

Minimal Flavour Violation

- The bulk *c* parameters have a dual 4D description by means of the holographic duality <sub>Contino,Pomarol</sub>
- The doublets in the LLHH case are completely elementary from the 4D point of view.
- However, the charged singlets are completely composite objects of the CFT.
- Composite singlets has 'interesting' flavour implications.

# Bulk Majorana case

#### Bulk Majorana mass term

Lepton mass and flavour violation in Randall Sundrum Models

Abhishek M Iyer

Randall-Sundrum Model

Mass Models LLHH case Dirac Neutrinos Bulk Majorana case

Constraints from Flavour

Minimal Flavour Violation Analysis with UV localized Majorana mass term has been considered earlier  ${\sf Huber\&Shafi}$  '04: Perez & Randall '09

Similar terms can be added in the bulk of RS but 'Majorana' mass terms in 5D do not have the same interpretation as is 4D.

$$S_N = \int d^4x \int dy \sqrt{-g} \left( m_M \bar{N} N^c + m_D \bar{N} N + \delta(y - \pi R) Y_N \bar{L} \tilde{H} N \right)$$

where 
$$N^c = C_5 \overline{N}^T$$
 and  $m_D = c_N k, m_M = c_M k$ .

#### **Eigenvalue Equations**

Lepton mass and flavour violation in Randall Sundrum Models

Abhishek M Iyer

Randall-Sundrum Model

Mass Models LLHH case Dirac Neutrinos Bulk Majorana case

Constraints from Flavour

Minimal Flavour Violation The eigenvalue equations for the left(right) profiles  $g_L(g_R)$  of N are

$$(\partial_y + m_D)g_L^{(n)}(y) = m_n e^{\sigma} g_R^{(n)}(y) - m_M g_R^{(n)}(y)$$
  
$$(-\partial_y + m_D)g_R^{(n)}(y) = m_n e^{\sigma} g_L^{(n)}(y) - m_M g_L^{(n)}(y)$$

We assume  $g_L(y)$  to be  $Z_2$  even. Zero mode solutions not consistent with boundary conditions.

The decoupled second order equations are difficult to solve generally and we solve them numerically.

#### Constraints on LHLH case

Lepton mass and flavour violation in Randall Sundrum Models

Abhishek M Iyer

Randall-Sundrum Model

Mass Models

Constraints from Flavour

Minimal Flavour Violation

- Doublets and the charged singlets couple universally to the KK gauge boson, thus leading order effects are highly suppressed.
  - $\bullet\,$  The large effective Yukawa coupling of the zero mode singlet to the KK mode  $\propto \sqrt{0.5-c}$
- The dipole processes due to gauge boson contribution is suppressed due to heavy KK scales.
- The large universal shift in the gauge coupling can be suppressed by either a very high KK gauge boson scale or by invoking custodial symmetry.

#### Constraints on Dirac Case

Lepton mass and flavour violation in Randall Sundrum Models

Abhishek M Iyer

Randall-Sundrum Model

Mass Models

Constraints from Flavour

Minimal Flavour Violation

# NO Point survives the $\mu \to e \gamma$ constraint-Requires fermionic KK scale $\mathcal{O}(10) {\rm TeV}$

#### Bulk Majorana case

Lepton mass and flavour violation in Randall Sundrum Models

Abhishek M Iyer

Randall-Sundrum Model

Mass Models

Constraints from Flavour

Minimal Flavour Violation For the tree-level decays, constraints obtained on the bulk masses apply in this case as well.

The dominant contribution to dipole decays in this case is due to Higgs exchange diagram.

Table: BR for dipole decays for the case with bulk Majorana mass

Hierarchy	$BR(\mu \to e\gamma)$	$BR(\tau \to \mu \gamma)$	$BR(\tau \to e\gamma)$
Inverted	$2.4 \times 10^{-5}$	$1.9 \times 10^{-5}$	$7.6  imes 10^{-6}$
Normal	$1.4 \times 10^{-5}$	$3.4 \times 10^{-5}$	$1.3 \times 10^{-5}$

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ の ○ ○

branching fractions are evaluated for  $M_{KK} \sim 1250 \text{ GeV}$ 

#### Need for Flavour symmetries

Lepton mass and flavour violation in Randall Sundrum Models

Abhishek M Iyer

Randall-Sundrum Model

Mass Models

Constraints from Flavour

Minimal Flavour Violation

- The constraints from dipole processes are far more severe. No point survives the  $\mu \to e\gamma$  constraint for low fermion KK scale.
- Large contributions to FCNC are due to the 'large' misalignment between the flavor structure of the diagram and the zero mode mass matrix.
- The mass square matrix in the charge lepton sector goes as  $Y_E F_E F_E^{\dagger} Y_E^{\dagger}$  while the mixing is controlled by  $Y_E Y_E^{\dagger}$

#### Flavour symmetries

Lepton mass and flavour violation in Randall Sundrum Models

Abhishek M Iyer

Randall-Sundrum Model

Mass Models

Constraints from Flavour

Minimal Flavour Violation

- The parameter space of Dirac and the bulk Majorana case are not consistent with flavour constraints.
- Turn to the ansatz of Minimal Flavour Violation (MFV)Perez & Randall, Mu-chun Chen & Hai-Bo Yu
- Dipole Constriaints can be satisfied for KK fermion scales as low as 3 TeV
- We are looking at various definitions of MFV applicable to the bulk Majorana case.

#### Summary and Conclusions

Lepton mass and flavour violation in Randall Sundrum Models

Abhishek M Iyer

Randall-Sundrum Model

Mass Models

Constraints from Flavour

Minimal Flavour Violation

- The LLHH case is not very favourable in the RS scenario owing to the extreme choice of bulk mass parameters required to fit the data.
- The Dirac and the bulk Majorana cases offers a very viable alternative.
- The constraints from flavour considerations are severe and one is forced to invoke flavour symmetries.
- Future work involves exploring various schemes of MFV in the Majorana case.

## Minimal Flavour Violation in Dirac Case

Cirigliano et al. '08

Lepton mass and flavour violation in Randall Sundrum Models

Abhishek M Iyer

Randall-Sundrum Model

Mass Models

Constraints from Flavour

Minimal Flavour Violation

- In the presence of right handed neutrinos the flavour group is  $SU(3)_L \times SU(3)_E \times SU(3)_N$
- $Y_E \to (3, \bar{3}, 1) \ Y_N \to (3, 1, \bar{3})$
- The Yukawa couplings are aligned with the five dimensional bulk mass matrices

$$c_L = a_1 I + a_2 Y'_E Y'_E^{\dagger} + a_3 Y'_N Y'_N^{\dagger} ; c_E = b Y'_E^{\dagger} Y'_E ; c_N = c Y'_N^{\dagger} Y'_N$$

- Owing to the flavor symmetry we work in a basis in which  $Y'_E$  is diagonal. In this basis  $Y'_N \to V_{PMNS} {\rm Diag}(Y'_N)$
- Flavor violating part

$$\Delta = Y'_N {Y'}_N^{\dagger}$$

• Lowering of fermion KK scale required to satisfy all constraints from dipole processes to as low as 3 TeV.

### MFV with bulk Majorana Neutrinos

Lepton mass and flavour violation in Randall Sundrum Models

Abhishek M Iyer

Randall-Sundrum Model

Mass Models

Constraints from Flavour

Minimal Flavour Violation

- We choose the flavour group  $SU(3)_L \times SU(3)_E \times O(3)_N$ 
  - $Y_E 
    ightarrow (3, \bar{3}, 1)$  and  $Y_N 
    ightarrow (3, 1, 3)$
  - The bulk Majorana term  $\bar{N}^c N$  transforms as (1,1,6)
  - The bulk mass parameters can be expressed as

$$c_{L} = a_{1}I + a_{2}Y'_{E}Y'_{E}^{\dagger} + a_{3}Y'_{N}Y'_{N}^{T}$$
$$c_{E} = 1 + bY'_{E}^{\dagger}Y'_{E} \quad c_{N} = 1 + cY'_{N}T'_{N} \quad c_{M} = dI_{3\times3}$$
