
Higgs-Portal Dark Matter and the LHC

Oleg Lebedev

DESY, Hamburg

Outline :

- Higgs key to the hidden sector
 - Higgs portal DM
 - LHC constraints
 - Vacuum stabilization
-

The Higgs key to the hidden sector

Motivation :

- ✓ $E_8 \times E_8$ strings
observable hidden
- ✓ dark matter
- ✓ ...

Special role of the Higgs :

Silveira, Zee '85
Foot, Lew, Volkas '91
...

$|H|^2$ = the only gauge and Lorentz-inv. dim-2 operator

$$L = a |H|^2 S^2 + b |H|^2 S$$

(S = "hidden" scalar)

$b=0$ (S has hidden charge):

$$L = a |H|^2 S^2$$

" S " is stable and couples weakly to SM --> **DARK MATTER (?)**

Vector Higgs portal:

OL, Lee, Mambrini '11

$$L = a |H|^2 V_\mu V^\mu + b (\bar{H} i D_\mu H V^\mu + \text{h.c.})$$

(V_μ = "hidden" vector)

$b=0$ ($V^\mu \leftrightarrow -V^\mu$ symmetry):

$$L = a |H|^2 V_\mu V^\mu$$

$$V^\mu = DM (?)$$

Higgs mechanism in the hidden sector :

$$L = -1/4 F_{\mu\nu} F^{\mu\nu} + D_{\mu} S^* D^{\mu} S - V(S) + \lambda/4 H^* H S^* S$$

$S \longrightarrow \text{VEV}$

$H^* H V_{\mu} V^{\mu}$ vertex

(Z_2 parity)

gauge invariance (+ minimal field content)

Z_2

Stueckelberg DM :

$$L = - \frac{1}{4} F_{\mu\nu} F^{\mu\nu} + \frac{1}{2} m^2 V_{\mu} V^{\mu}$$

Here : $V_{\nu} \equiv V'_{\nu} + 1/\mu \partial_{\nu} \phi$

Gauge transform: $\left\{ \begin{array}{l} \delta V'_{\nu} = \partial_{\nu} \varepsilon \\ \delta \phi = - \mu \varepsilon \end{array} \right.$

In general : $m^2 = \mu^2 (1 + c H^* H + \dots)$

$\Rightarrow H^* H V_{\mu} V^{\mu}$ coupling

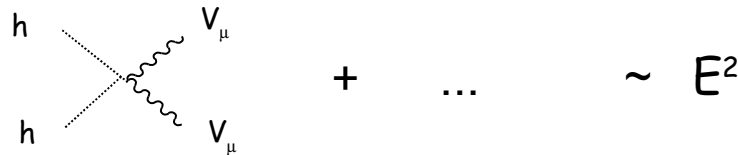

Unitarity:

$$L = \frac{1}{4} \lambda |H|^2 V_\mu V^\mu + \frac{1}{2} m^2 V_\mu V^\mu$$

Physical mass :

$$m_V^2 = m^2 + \frac{1}{2} \lambda v^2$$

Cutoff :

$$+ \dots \sim E^2$$

$$E \sim m_V^2 / m$$

$$(\cdot \sqrt{16\pi / \lambda})$$

Dark matter constraints

DM-nucleon scattering

annihilation

$$\langle \sigma v \rangle$$

$$\sigma_{S-P}^{SI}$$

invisible Higgs decay

$$\Gamma_H^{inv}$$

First glimpse of the Higgs :

$m_h \sim 125 \text{ GeV}$

First constraints on BSM :

Giardino et al. '12
Espinosa et al. '12

$$\text{Br}_{\text{inv}} < 30\text{-}50 \%$$

E.g. SUSY :

Dreiner, Kim, OL '12

$$\mu < 170 \text{ GeV}$$

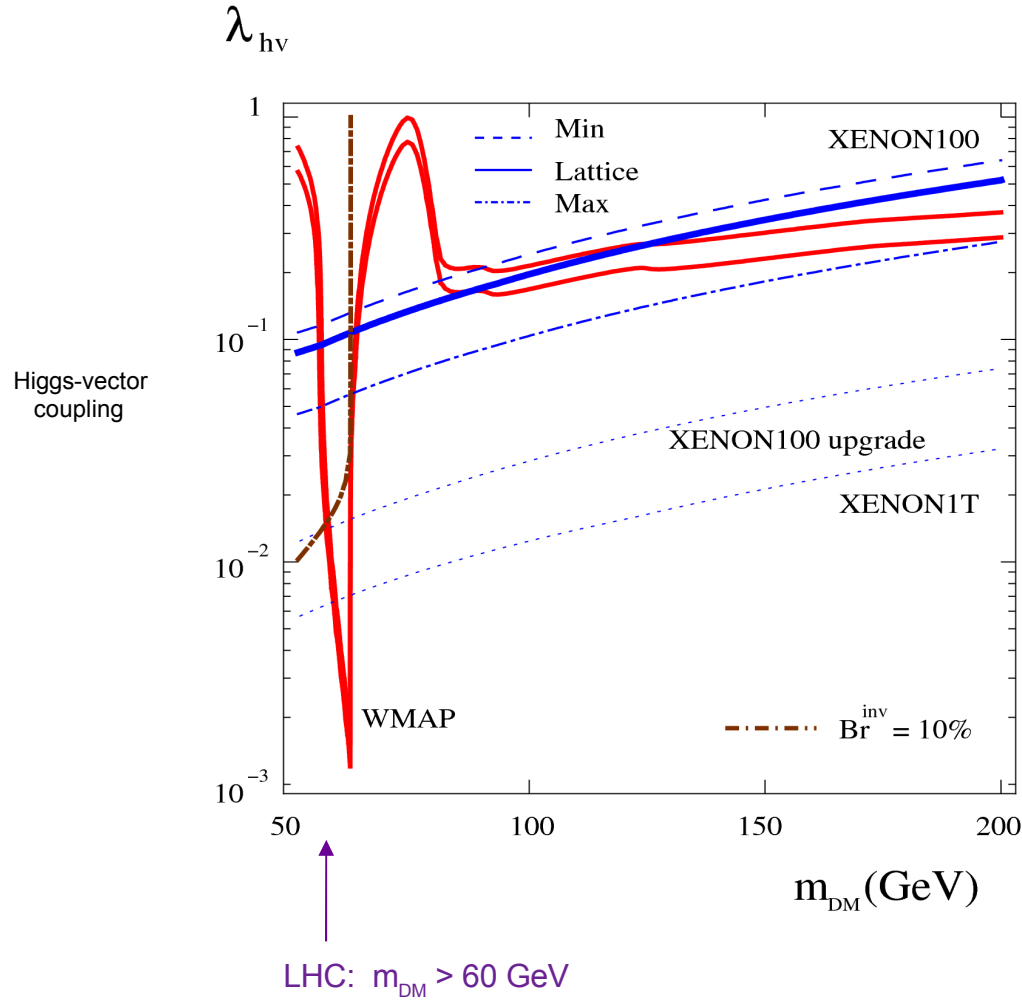

$$M_1 < 70 \text{ GeV}$$

*strongly
disfavored*

DM constraints :

WMAP: annihilation cross section
XENON : DM-nucleon interaction
LHC : invisible Higgs decay

Djouadi, OL, Mambrini, Quevillon '11
OL, Lee, Mambrini '11

Scalar vs Vector DM :

annihilation :

$$g_{\text{vector}}^2 = 3 g_{\text{scalar}}^2$$

(3 species)

direct detection :

same

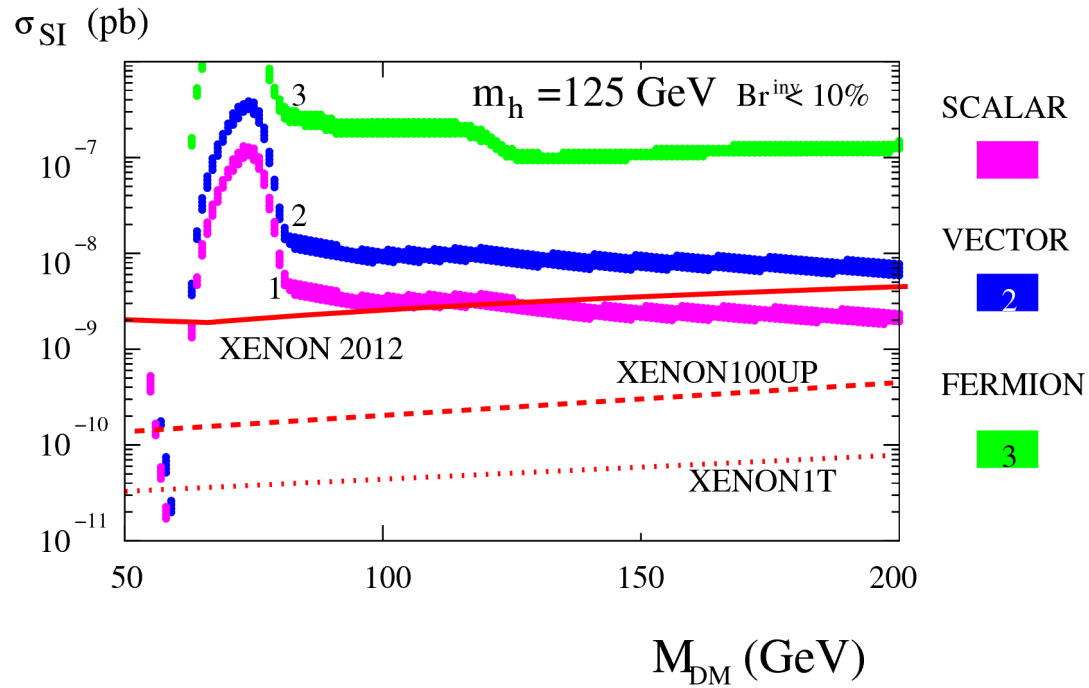

(Higgs exchange)

Higgs decay :

$$\Gamma_{\text{vector}} \sim m_h^4 / m_V^4 \Gamma_{\text{scalar}}$$

(Goldstone production)

Prediction :

DM direct detection with $\sigma \sim 10^{-8} - 10^{-9}$ pb

A more general case :

Schabinger, Wells '05
Patt, Wilczek '06

$$L = c |H|^2 S^2$$

(S has a VEV)

$$\left\{ \begin{array}{l} H_1 = H \cos \theta + S \sin \theta \\ H_2 = H \sin \theta - S \cos \theta \end{array} \right.$$

two Higgs-like states , rate reduction

If $\langle S \rangle \gg 246 \text{ GeV}$,

$$\left\{ \begin{array}{l} \theta \rightarrow 0 \quad (\text{SM-like Higgs}) \\ m_h^2 = 2 v^2 [\lambda_h - \lambda_{hs}^2 / (4\lambda_s)] \end{array} \right.$$

Degrassi et al.'12

Stability bound:

$$m_h > 126 \text{ GeV at 98\% CL}$$

Singlet tree level
effect :

$$\lambda_s = 0.01$$
$$t = \ln(\mu/m_t)$$

a (very) weakly coupled singlet can make the EW vacuum stable

- favored by cosmology
- Higgs inflation
- ...

OL'12

Conclusion

- Higgs sector is special
 - vector/scalar Higgs-portal DM
 - constrained by LHC , $m_{DM} > 60 \text{ GeV}$
 - vacuum stabilization
-
