

# Higgs Physics in ATLAS and CMS

Rainer Mankel (DESY)  
for the ATLAS + CMS collaborations

Corfu Summer Institute: Workshop on the  
Standard Model and Beyond,  
*28 Aug-7 Sep 2023, Corfu (Greece)*

# Introduction

- The Higgs boson  $H$  observed in 2012 at a mass of 125 GeV gave striking support to the principle of spontaneous symmetry breaking in the electroweak theory  $\rightarrow$  origin of elementary particles' masses
- Its discovery opened a rich field of research to address various questions, including:

Precise mass and dynamics of production & decay?

Do rare decay channels exist?

Anomalous couplings?

Do Yukawa interactions preserve lepton flavor?

Shape of Higgs potential?

Trilinear and quartic couplings?

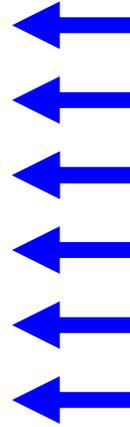

Extended Higgs sector?

# Outline

## Matching the previous questions

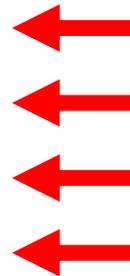

- Higgs boson mass and couplings
- Rare decay  $H \rightarrow Z\gamma$
- Higgs boson production at very high  $p_T$
- Differential cross sections
- Higgs pair production and self-coupling

**Precision  
measurements of the  
H boson properties**

- Search for resonant Higgs boson production
- Search for low-mass Higgs bosons
- Search for flavor-violating Higgs boson decays

**Searches for BSM  
Higgs boson physics**

# Precision measurements of the H boson properties

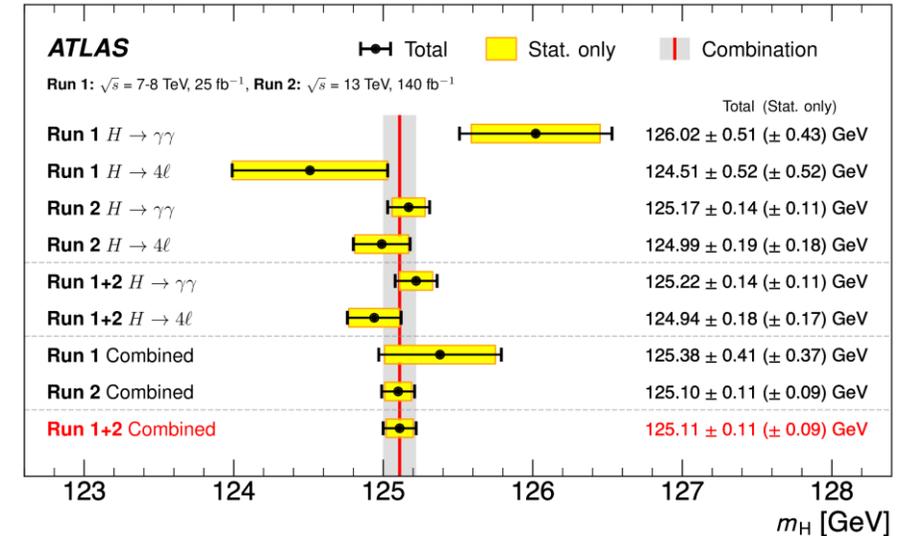

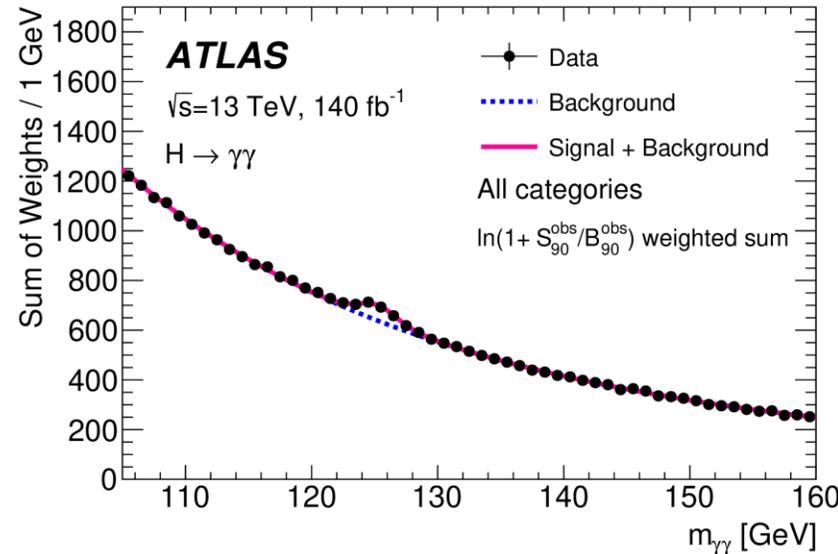

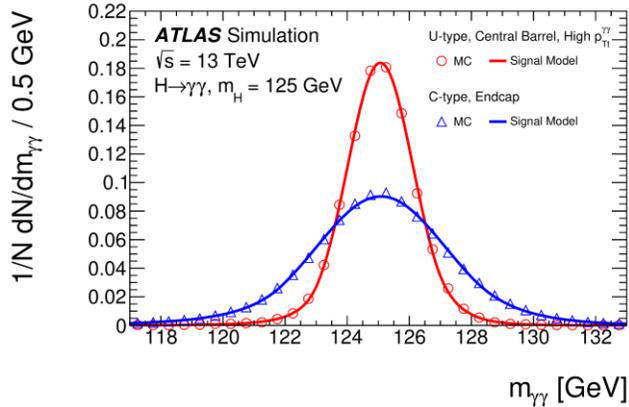

# Measurement of Higgs boson mass: $H \rightarrow \gamma\gamma$

And combination with  $H \rightarrow 4\ell$

arxiv:2308.07216 submitted to Phys.Lett. B  
arxiv:2308:04775

- Precise knowledge of H mass essential e.g. for theory predictions
- Photon calibration has been **dramatically improved**: 320 MeV  $\rightarrow$  80 MeV systematic uncertainty

Full Run 2 result  $H \rightarrow \gamma\gamma$  :  $m_H = 125.17 \pm 0.11 (stat.) \pm 0.09 (syst.) \text{ GeV} = 125.17 \pm 0.14 \text{ GeV}$   
 Combination  $H \rightarrow \gamma\gamma + H \rightarrow 4\ell$ , Run 1+2:  $m_H = 125.11 \pm 0.09 (stat.) \pm 0.06 (syst.) \text{ GeV} = 125.11 \pm 0.11 \text{ GeV}$

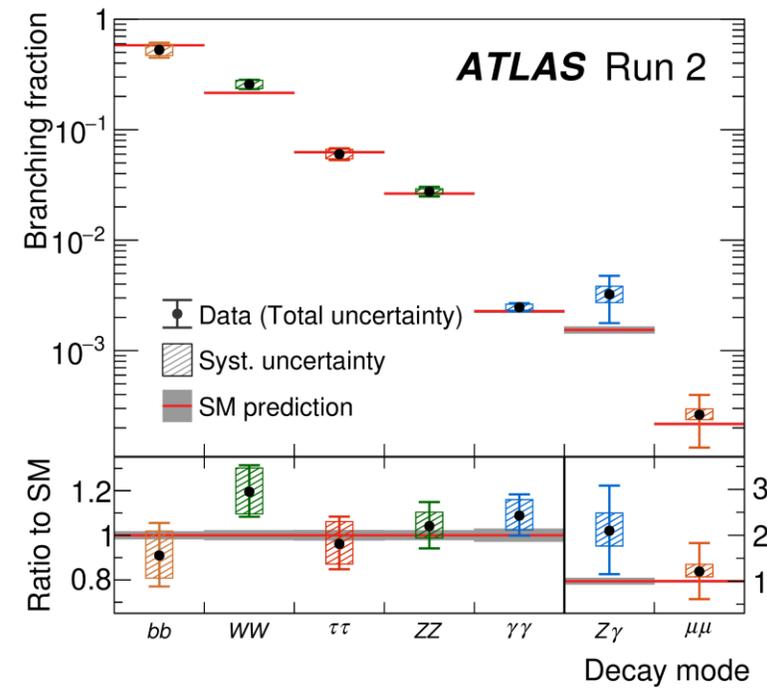

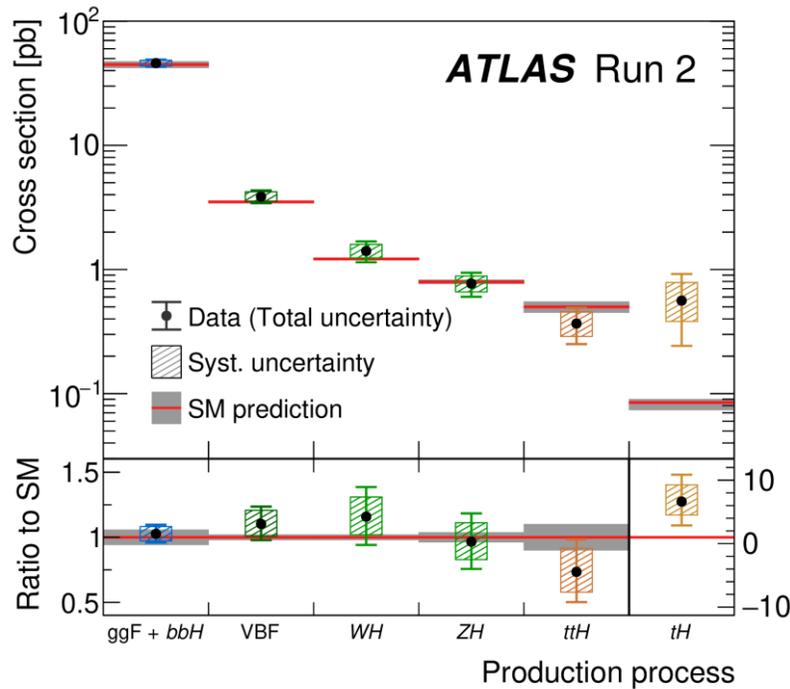

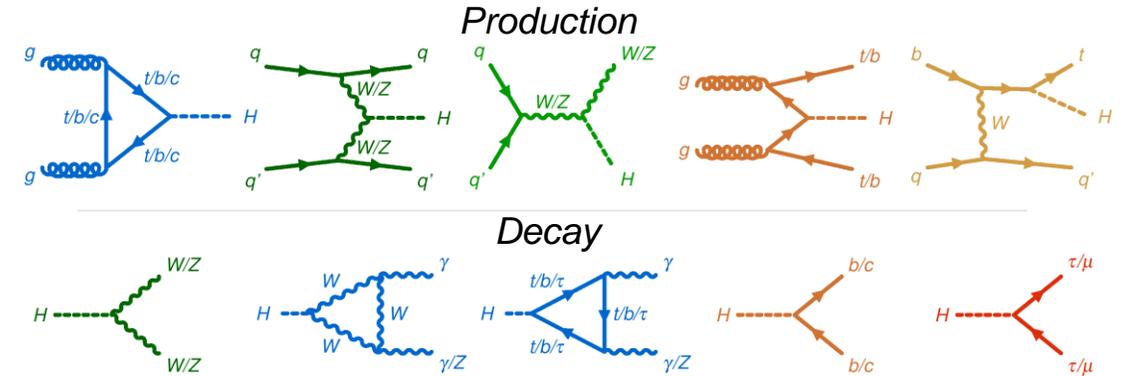

**$\rightarrow$  Most precise  $m_H$  measurement to date (0.09% precision)**

# Higgs production and decay

ATLAS Nature 607 (2022) 52-59

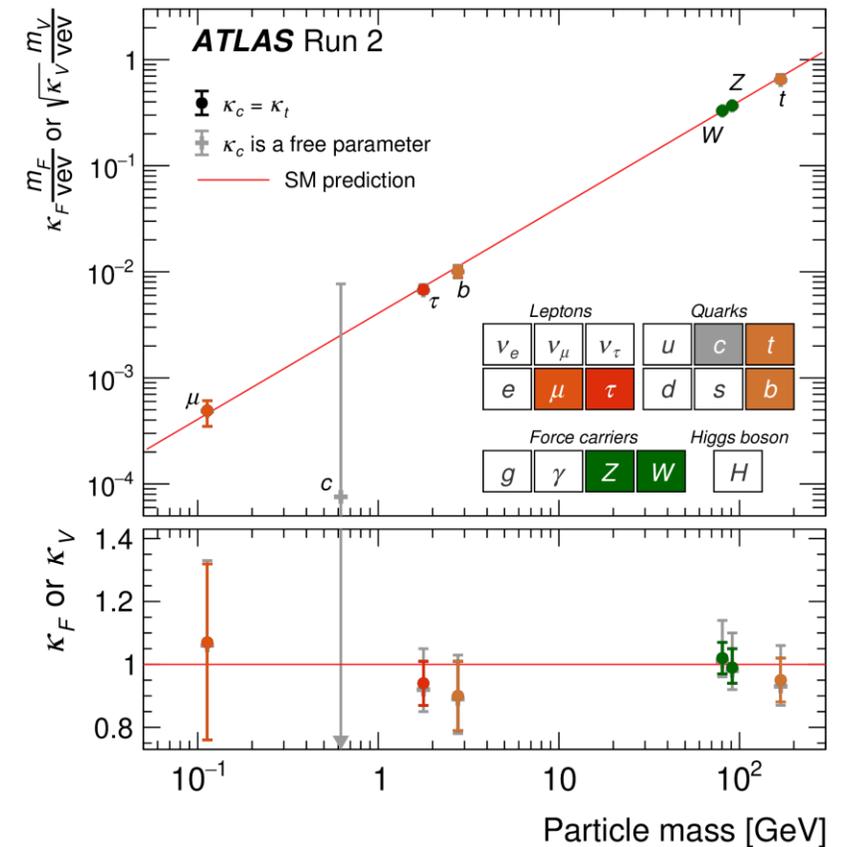

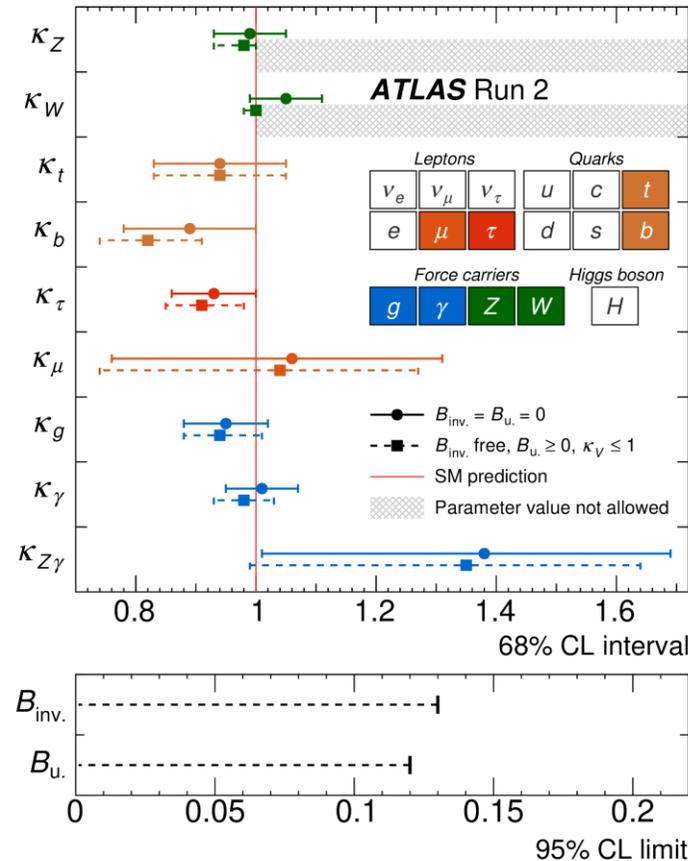

- Production and decay channels of the H boson have been intensively studied
- ➔ At Run 2 precision, production cross sections and decay branching fractions agree well with SM

# Higgs couplings

ATLAS Nature 607 (2022) 52-59

- Combination of production and decay measurements is used to determine modifiers of reduced H couplings to fermions and bosons
- ➔ All measured couplings agree with the SM predictions
- ➔ Scaling with  $m_F$  and  $m_V^2$  as expected
- ➔ Strong constraints on invisible / undetectable decays of the H boson beyond the SM

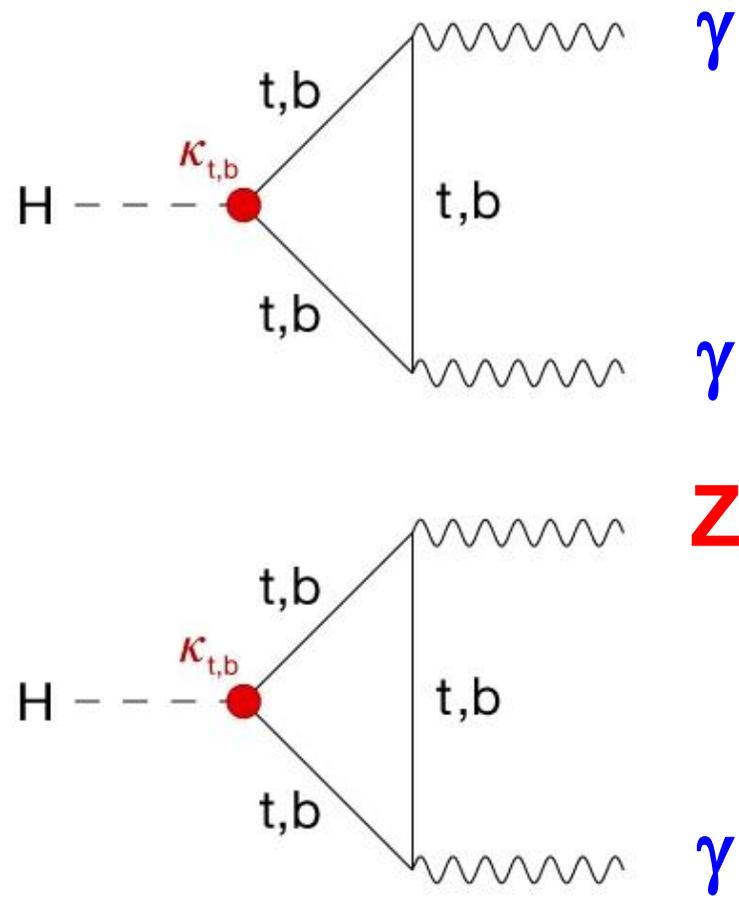

for CMS couplings results, see [Nature 607 \(2022\) 60-68](#)

# The decay $H \rightarrow Z\gamma$

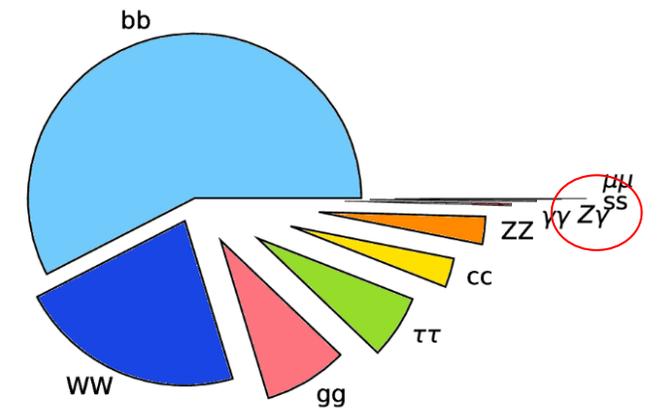

One of the rarest accessible decays

**NEW!**

ATLAS-CONF-2023-005  
CMS PAS HIG-23-002

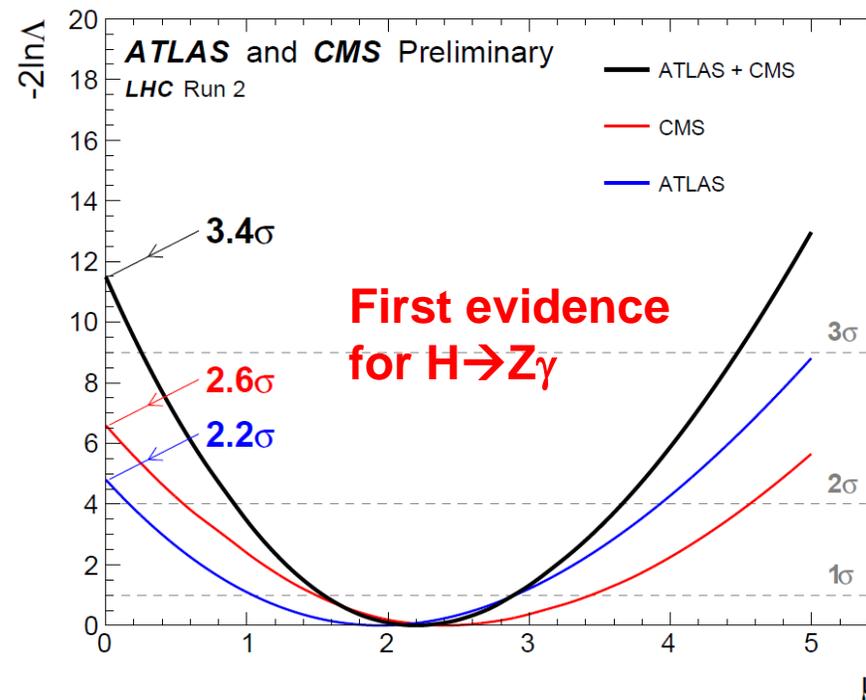

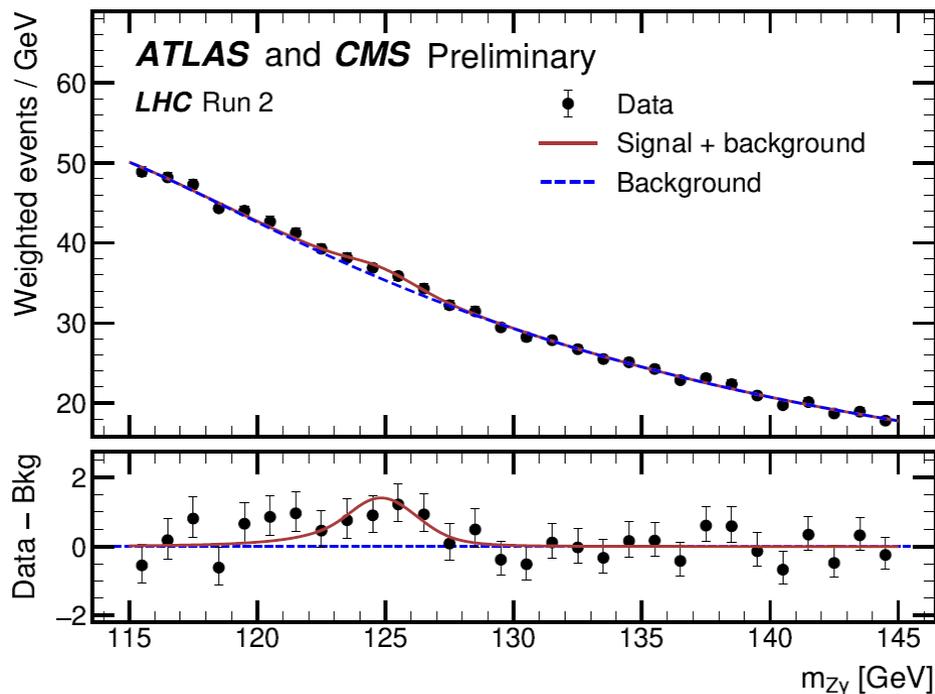

- SM:  $B(H \rightarrow \gamma\gamma) = 2.3 \cdot 10^{-3}$
- discovered in 2012

- SM:  $B(H \rightarrow Z\gamma) = 1.5 \cdot 10^{-3}$ 
  - similar diagram
  - but  $B(Z \rightarrow ee, \mu\mu)$  gives additional reduction factor of 0.066
  - ➔ more difficult to measure
- Sensitive to BSM effects which might modify the branching fraction relative to the SM

# The decay $H \rightarrow Z\gamma$ (cont'd)

ATLAS-CONF-2023-005  
CMS PAS HIG-23-002

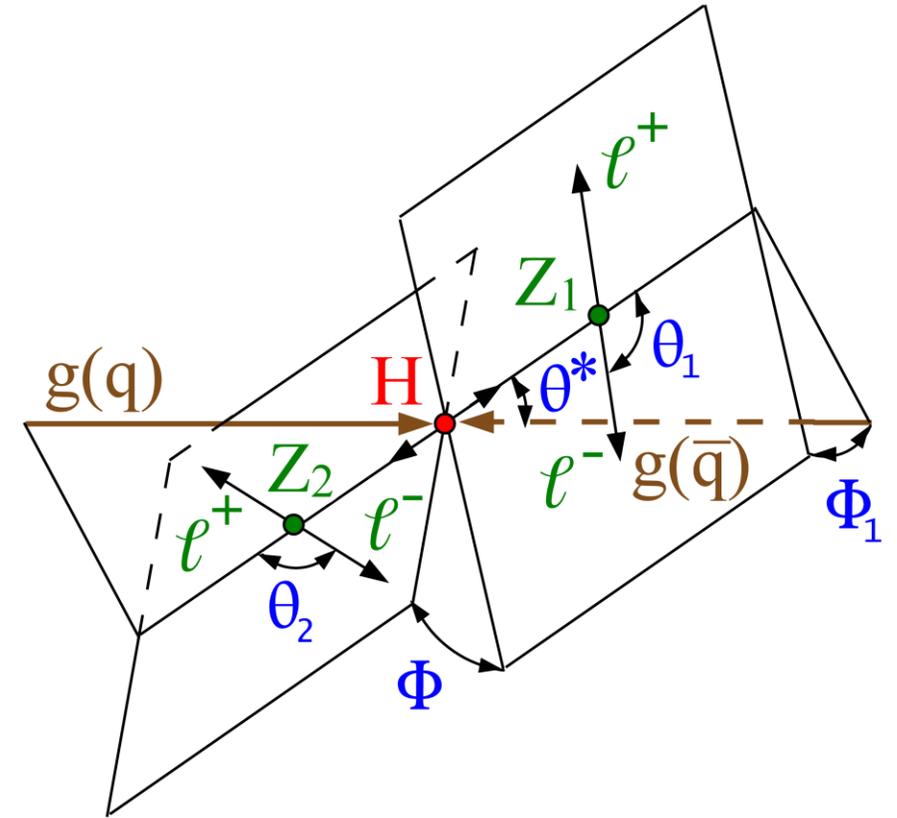

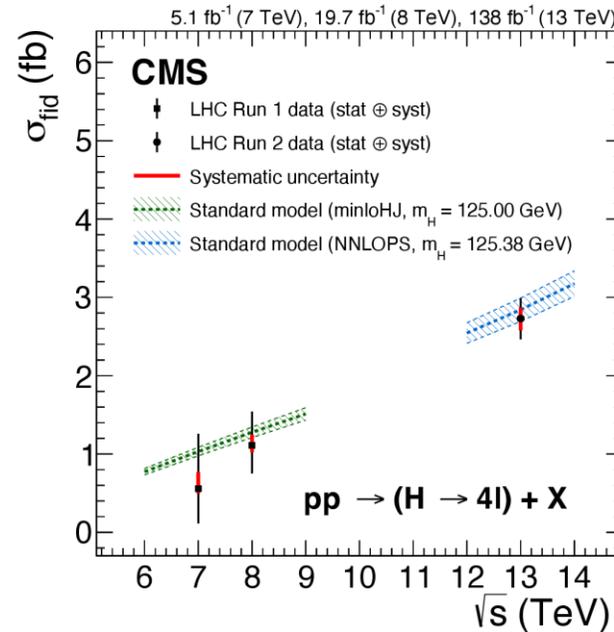

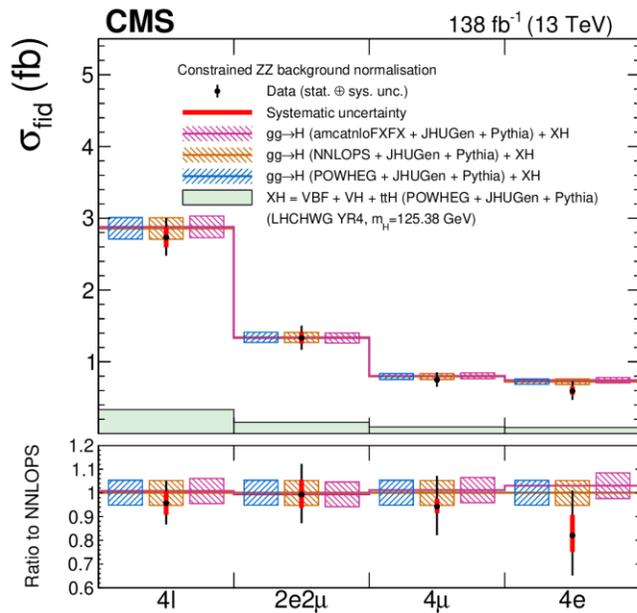

$\sim 140 \text{ fb}^{-1}$  per experiment!

$\mu = \text{signal strength relative to SM}$

- Combination of analyses by ATLAS and CMS (each with  $> 2\sigma$  significance)
- ➔ Combined signal strength:  $\mu = 2.2 \pm 0.7$  agrees with SM, combined significance  $3.4\sigma \text{ obs.}$  ( $1.6\sigma \text{ exp.}$ )
- ➔ **First evidence** for this Higgs boson decay mode

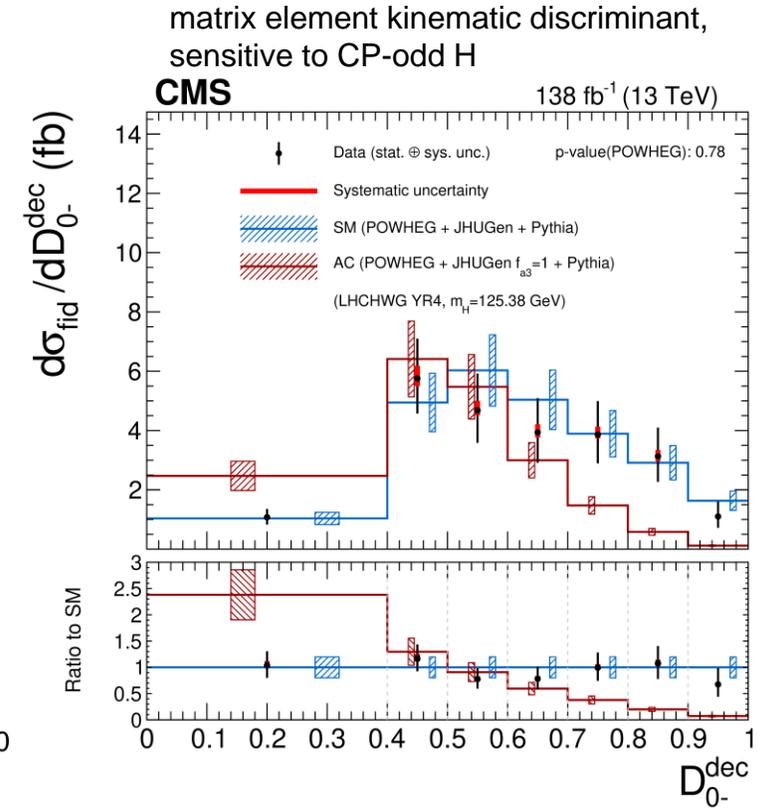

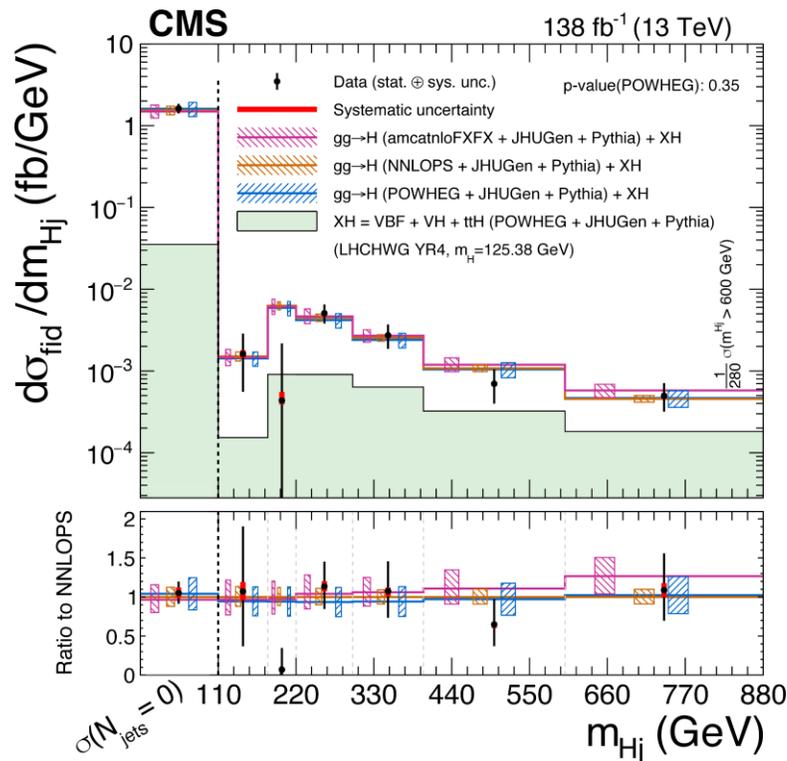

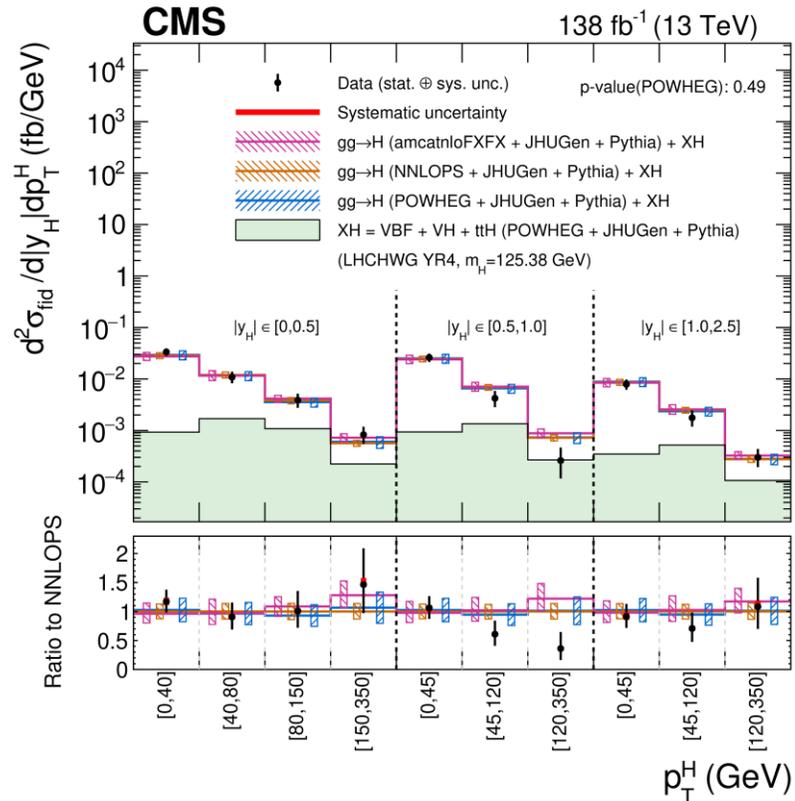

# Differential cross sections in $H \rightarrow 4\ell$

- $\ell = e, \mu \rightarrow$  Very clean signature, excellent resolution, analyzed with full Run 2 dataset
- Cross sections measured in fiducial kinematic region of detector minimize theory dependence  $\rightarrow$  **excellent agreement with SM**

# Differential cross sections in $H \rightarrow 4\ell$ (cont'd)

- Detailed (even double-) differential cross sections are measured, testing production models
  - dynamics of H boson and additional jets
  - constraining **anomalous couplings**

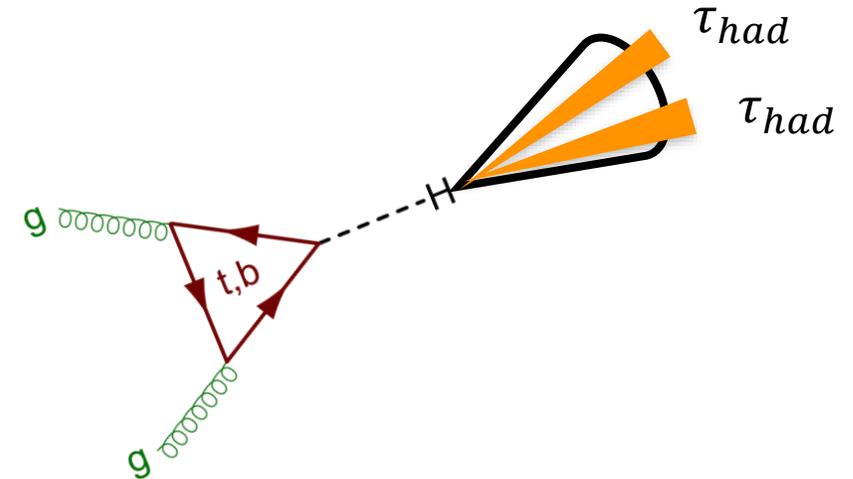

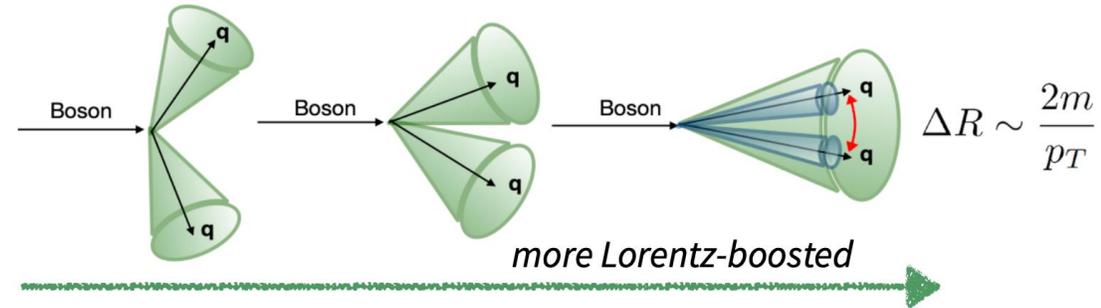

# H production at very high $p_T$

## Highly Lorentz-boosted $H \rightarrow \tau\tau$

- Measure H production for  $p_T^H > 250 \text{ GeV}$ 
  - boosted topology  $\rightarrow$  decay products are collimated
  - four main decay channel combinations used:  
 $\tau_e\tau_\mu, \tau_e\tau_{had}, \tau_\mu\tau_{had}, \tau_{had}\tau_{had}$
  - dedicated algorithm based on substructure techniques used to separate the two  $\tau_{had}$  candidates
- Resulting signal strength wrt SM:  $\mu = 1.64^{+0.68}_{-0.54}$ 
  - $\rightarrow$  in agreement with SM
  - significance:  $3.5 \sigma$  ( $2.2 \sigma$  exp.)

$\rightarrow$  First measurement of highly boosted  $H \rightarrow \tau\tau$

CMS PAS HIG-21-017

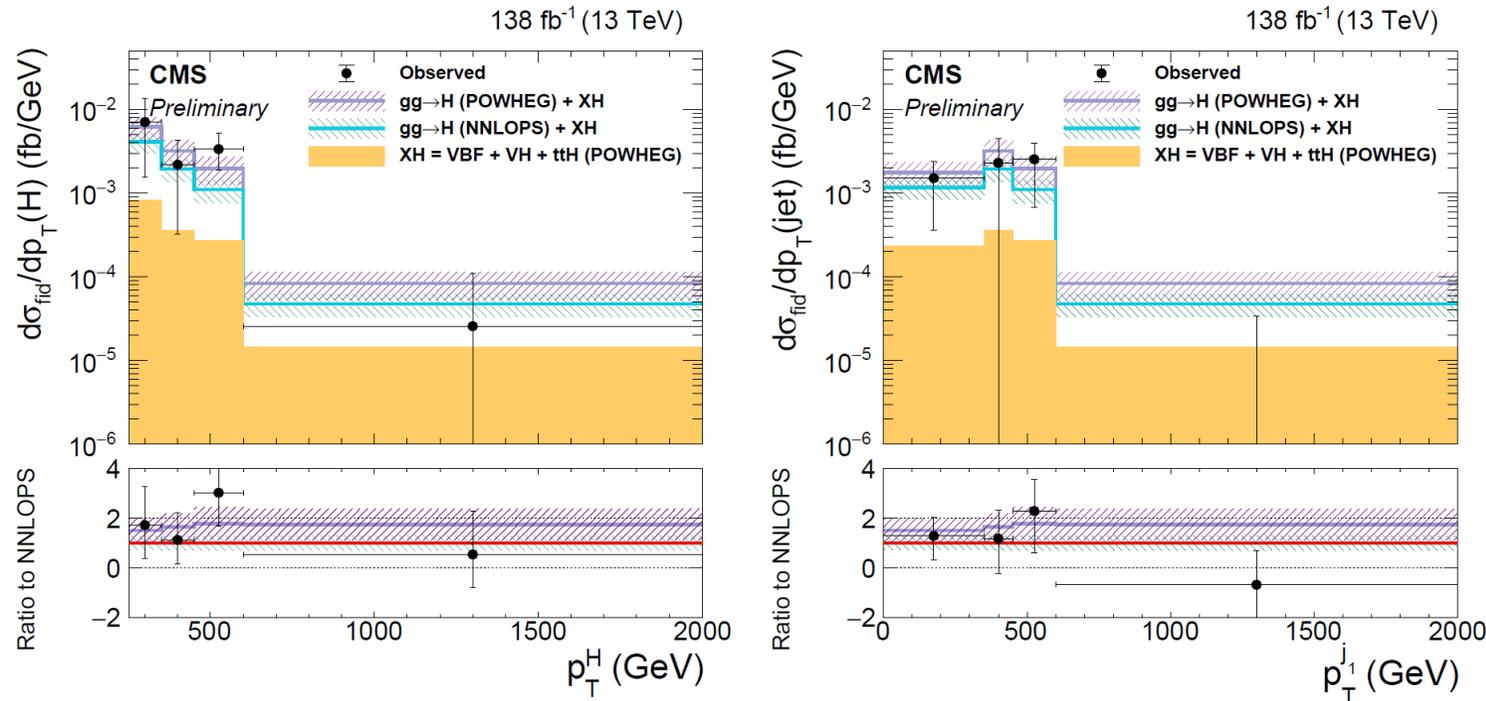

# H production at very high $p_T$ (cont'd)

## Highly Lorentz-boosted $H \rightarrow \tau\tau$

CMS PAS HIG-21-017

- In addition, measure fiducial differential cross sections
  - as functions of  $p_T^H$  and  $p_T$  of leading jet, four bins each

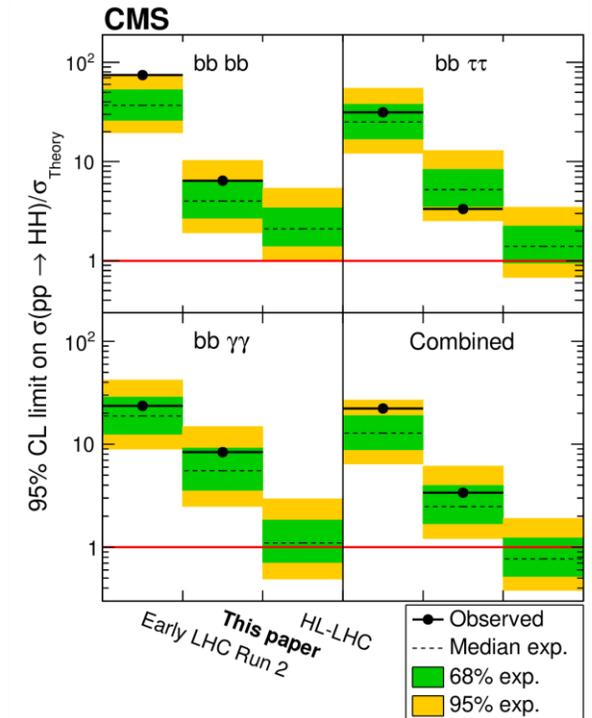

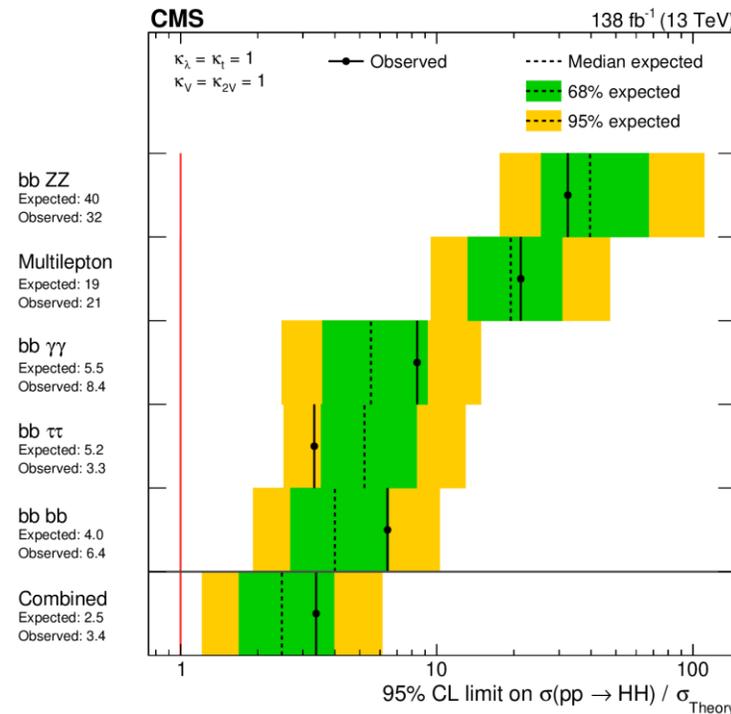

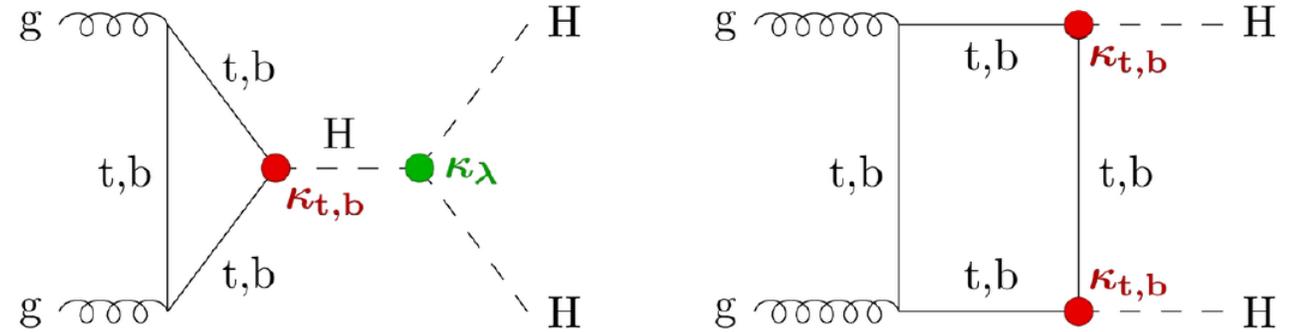

- Comparison with models (two generators for gluon fusion process)

# Pair production of Higgs bosons

ATLAS Phys.Lett. B 843 (2023) 137745  
 CMS Nature 607 (2022) 60-68

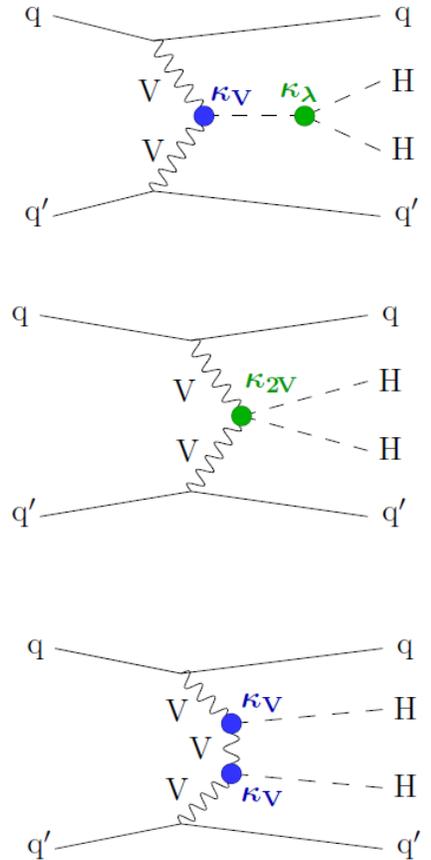

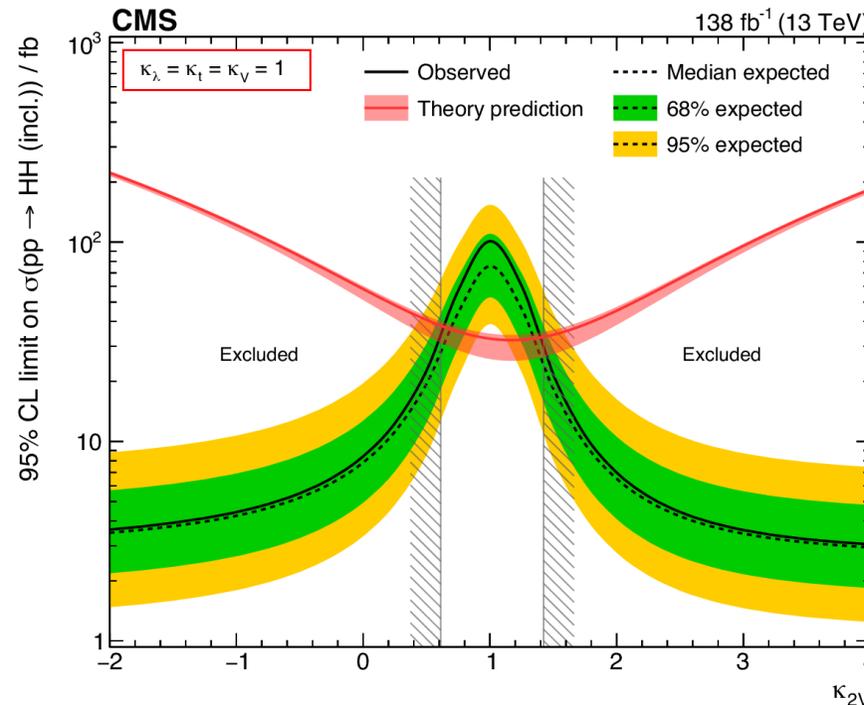

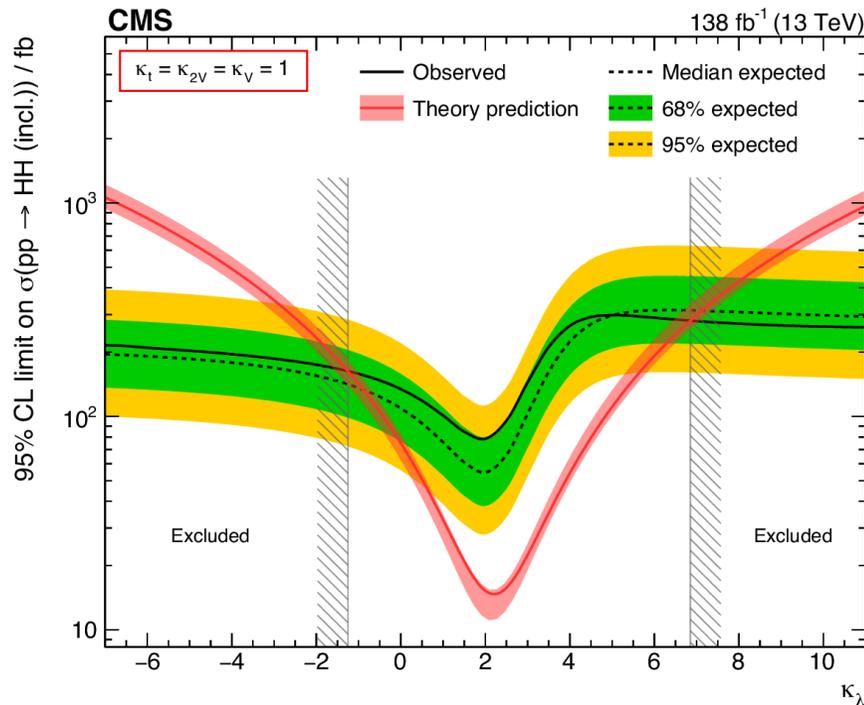

- Fundamental test of the SM
- Directly sensitive to the **trilinear Higgs coupling**
  - destructive interference, small cross section
- Full Run 2,  $\sigma_{HH}$  relative to SM:
  - $\mu_{HH} < \begin{cases} 3.4 (2.5 \text{ exp.}) & \text{CMS} \\ 2.4 (2.9 \text{ exp.}) & \text{ATLAS} \end{cases} @95\% \text{ CL}$
- **Strong improvement** wrt initial Run 2 results with 2016 data ( $35.9 \text{ fb}^{-1}$ )
  - luminosity, **enhanced methodology**
- ➔ At HL-LHC, expect to establish HH production at SM level

# Pair production of Higgs bosons (cont'd)

ATLAS Phys.Lett. B 843 (2023) 137745  
 CMS Nature 607 (2022) 60-68

- Strong constraints on the modifier of the trilinear Higgs coupling,  $\kappa_\lambda$ 
  - $-0.6 < \kappa_\lambda < 6.6$  (ATLAS),  $-1.24 < \kappa_\lambda < 6.49$  (CMS), @ 95% CL
- VBF production also establishes non-zero quartic VVHH coupling **at 6.6  $\sigma$** 
  - $0.1 < \kappa_{2V} < 2.0$  (ATLAS),  **$0.67 < \kappa_{2V} < 1.38$**  (CMS), @ 95% CL

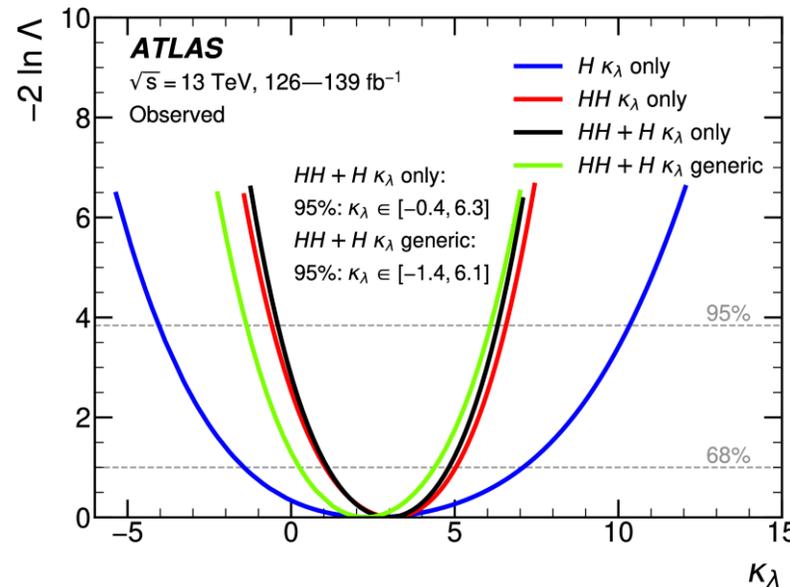

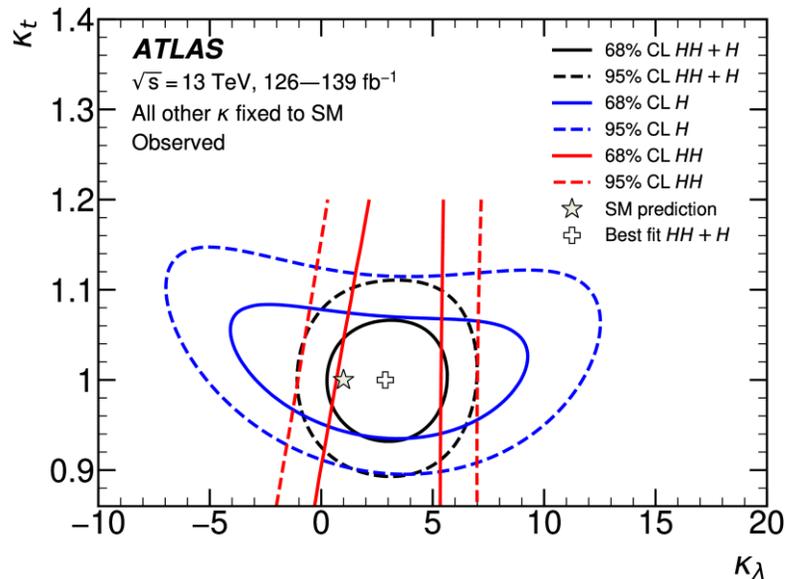

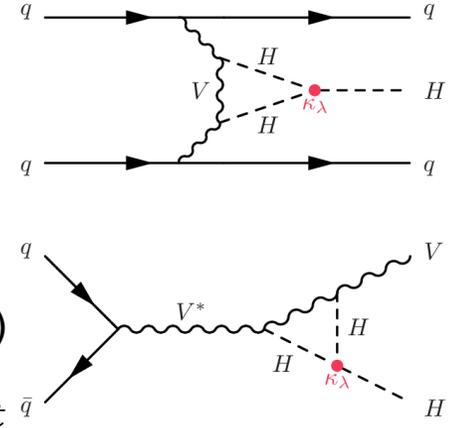

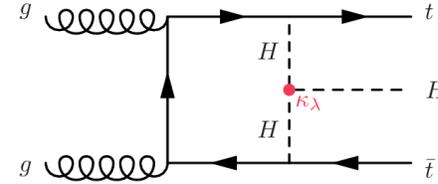

# Combining single- and double-Higgs production

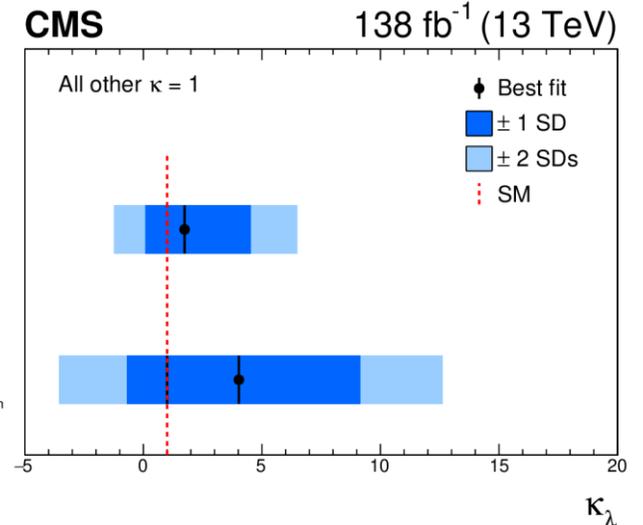

ATLAS Phys.Lett. B 843 (2023) 137745

- Also single-Higgs boson production is sensitive to the trilinear Higgs coupling by means of **NLO corrections**
- Combined results of H + HH production (ATLAS):
  - assuming SM for all other H interactions:  $-0.4 < \kappa_\lambda < 6.3$  @ 95% CL obs. ( $-1.9 < \kappa_\lambda < 7.6$  exp.)
- Addition of single H analyses allows relaxing of assumptions on coupling modifiers like  $\kappa_t$

CMS Nature 607 (2022) 60-68

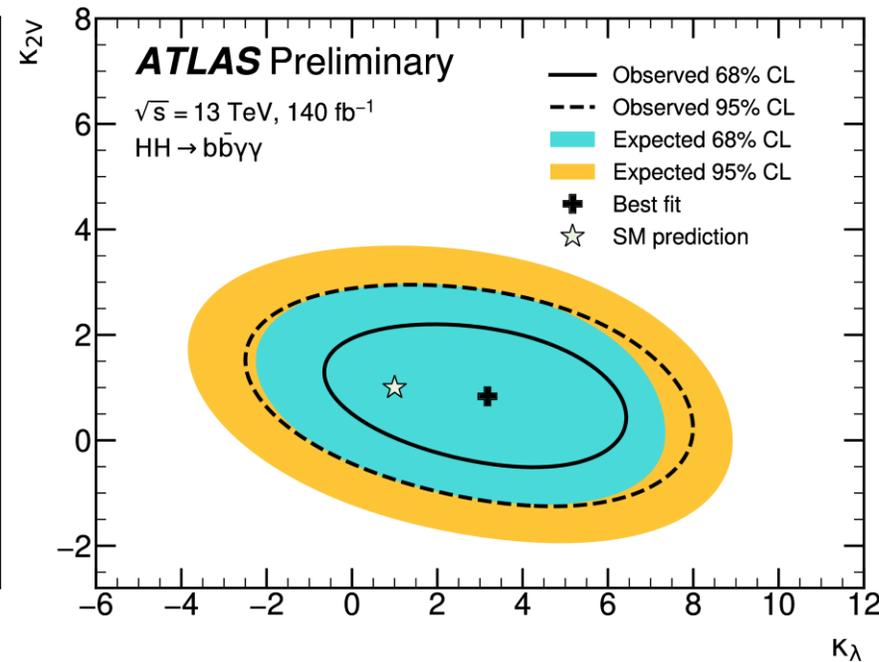

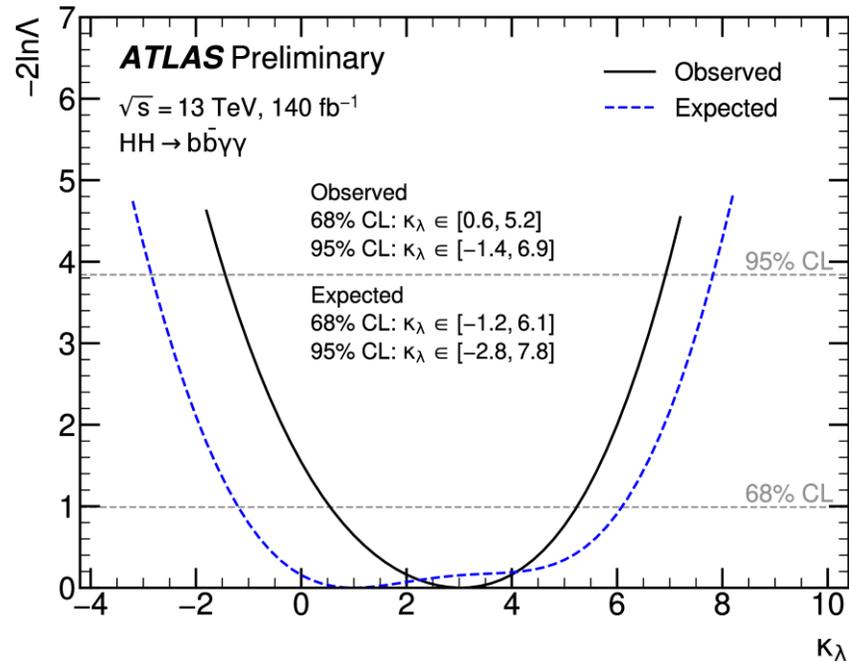

# Improved search for HH in the $b\bar{b}\gamma\gamma$ channel

ATLAS-CONF-2023-050

- Supersedes and expands the previous ATLAS analysis
  - event classification based on multivariate classifier  $\rightarrow$  improved sensitivity to  $\kappa_\lambda$  and  $\kappa_{2V}$
  - interpretation within **effective field theory** (HEFT, SMEFT)

all other coupling modifiers fixed to SM predictions

$\rightarrow \mu_{HH} < 4.0$  (6.4 *exp.*) at 95% CL.

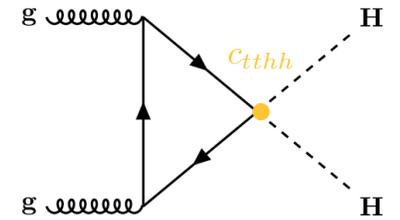

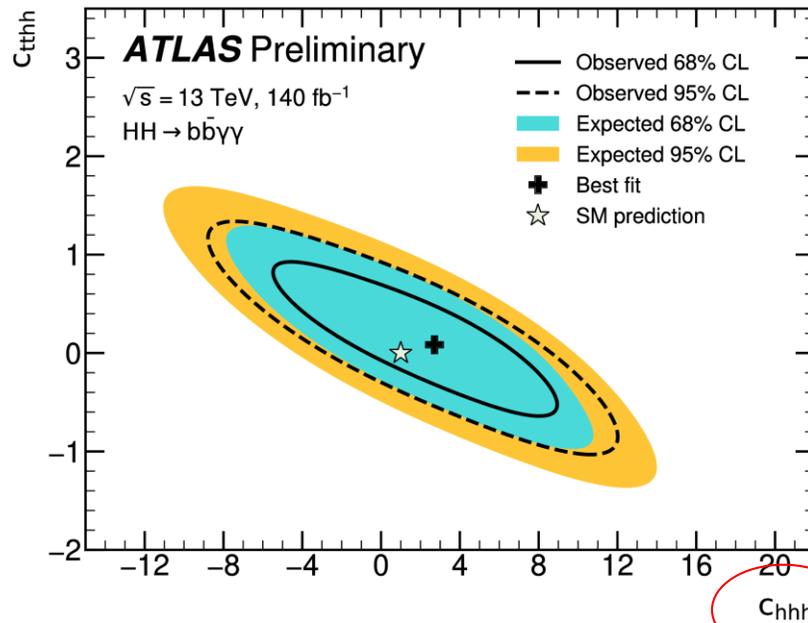

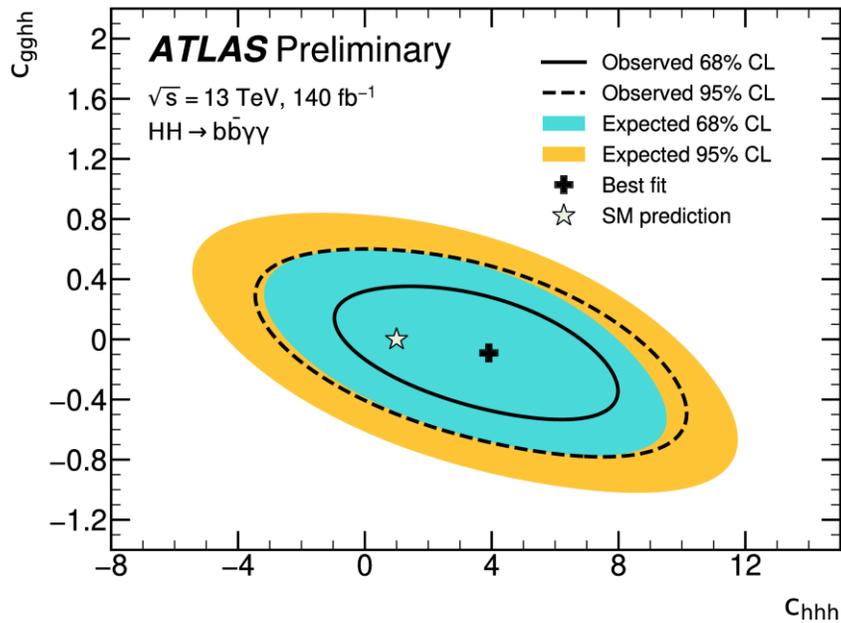

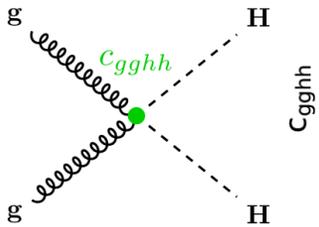

$-1.4 < \kappa_\lambda < 6.9$  at 95% CL

# Improved search for HH in the $b\bar{b}\gamma\gamma$ channel (cont'd)

ATLAS-CONF-2023-050

- This analysis is also used to search for anomalous contributions from extensions of the SM
  - described by Wilson coefficients of operators describing these anomalous interactions
  - here: constraints on Wilson coefficients of Higgs effective field theory (HEFT)

All other coefficients fixed to SM predictions

No impact on H boson production and decay at tree level

➔ Perfect agreement with SM

$C_{hhh}$  ←  $\kappa_\lambda$

# Searches for BSM Higgs boson physics

# Higgs physics beyond the Standard Model

Only a small selection

## ➤ Extended Higgs sectors

- NMSSM: two Higgs doublets and one singlet
  - three CP-even (one of them H), two CP-odd and two charged Higgs bosons
- Two Higgs doublet models (2HDM)
  - two CP-even Higgs bosons (one of them H), one CP-odd and two charged Higgs bosons
  - in general, lepton flavor non-conservation possible

Signatures:

$X \rightarrow SH$

$X \rightarrow HH$

light scalars ( $m < 125$  GeV)

Signatures:

$H \rightarrow e\mu$ ,  $H \rightarrow \tau\mu$ ,  $H \rightarrow \tau e$  decays

## ➤ Warped extra dimensions (WED)

- heavy resonances:
  - spin 0: Radion ( R )
  - spin 2: Kaluza-Klein graviton (G)

Signatures:

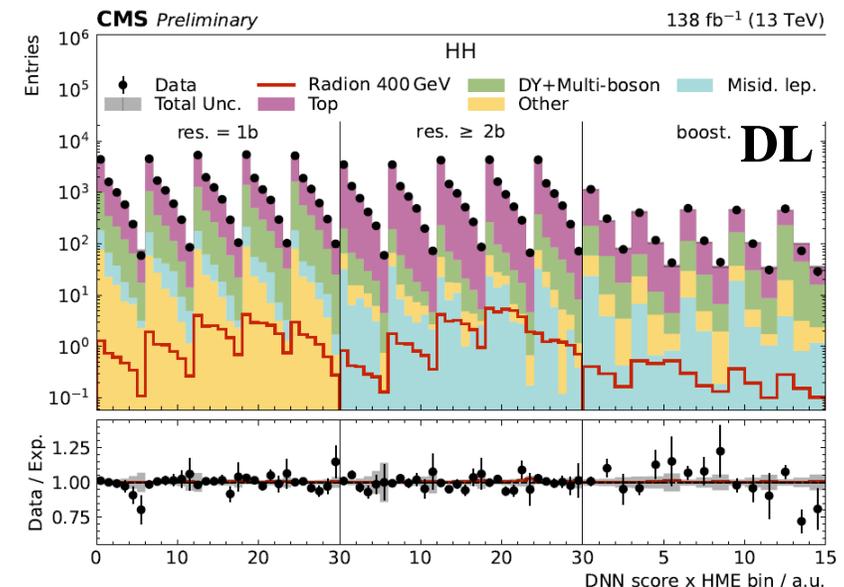

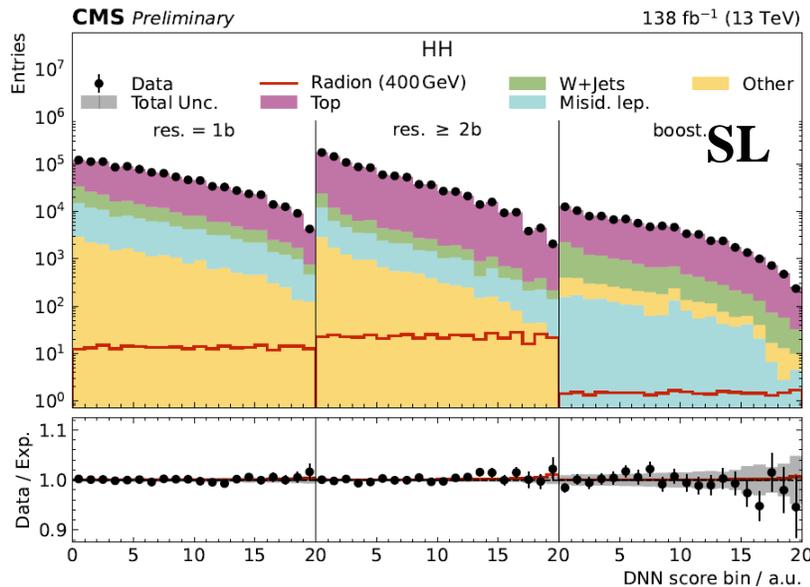

$R \rightarrow HH$

$G \rightarrow HH$

# Search for $X \rightarrow HH \rightarrow bb WW$

Going beyond the "big three" ( $bbbb$ ,  $bb\gamma\gamma$ ,  $bb\tau\tau$ )

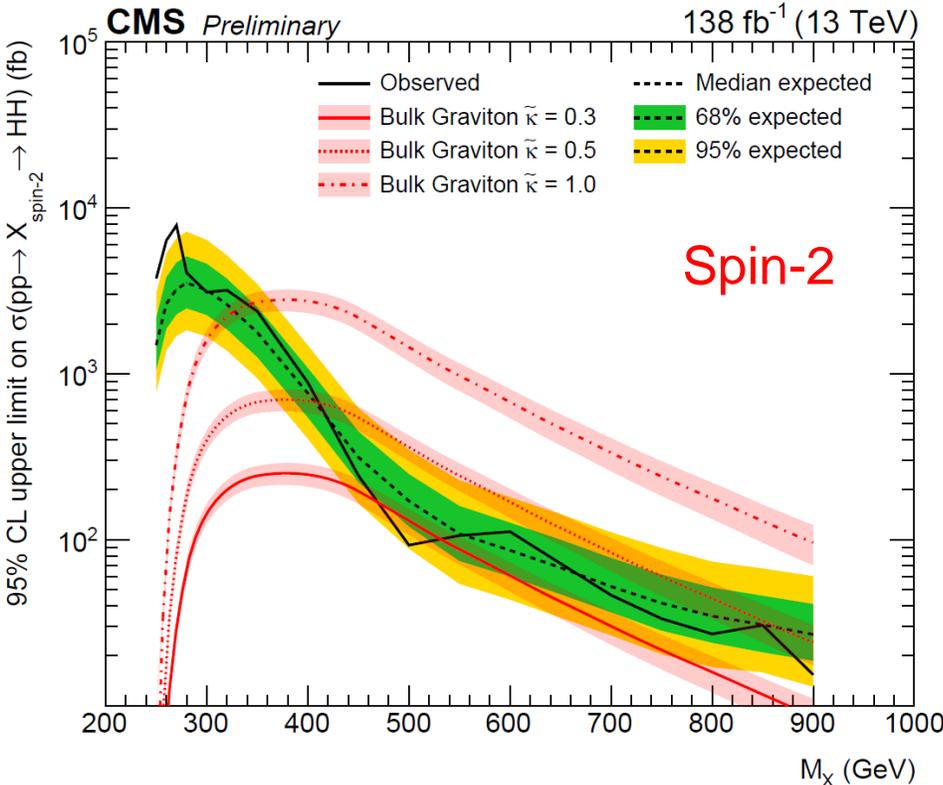

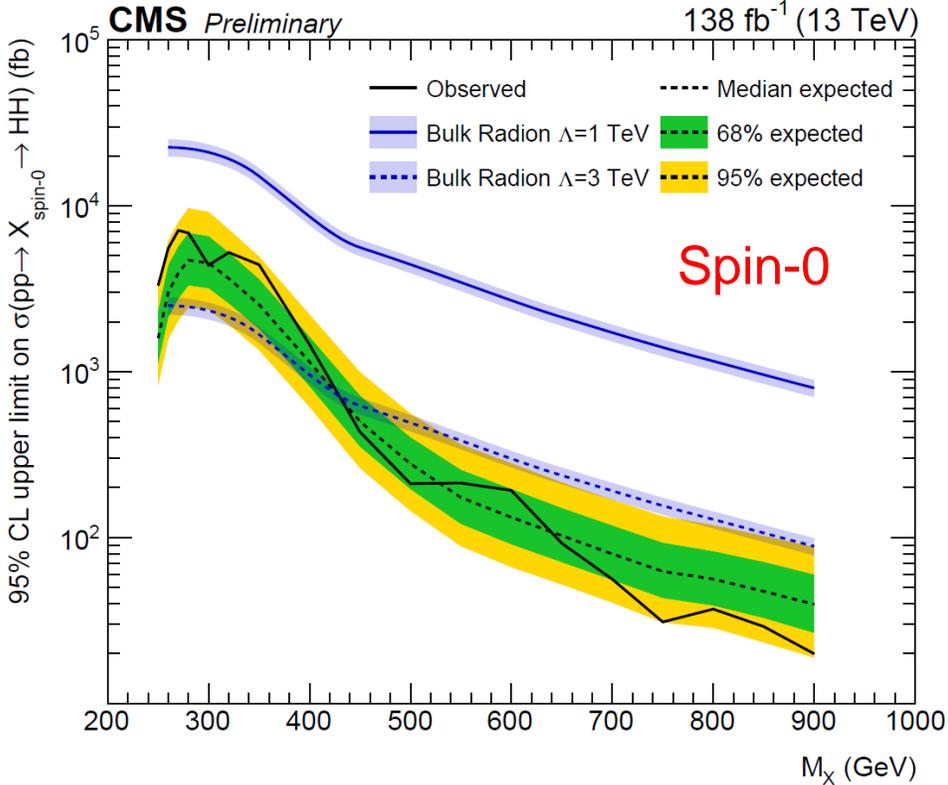

- Motivated by Warped Extra Dimensions and Extended Higgs sector models
- $HH \rightarrow bbWW$  channel has the **second largest combined branching fraction**
  - single-lepton ( $bb\ell\nu qq$ ) and di-lepton ( $bb\ell\nu\ell\nu$ ) final states (non-resonant analysis not shown)
- Multiclass DNN to classify events according to processes
- Signal extraction by simultaneous fit to all signal and background DNN discriminant distributions

# Search for $X \rightarrow HH \rightarrow bbWW$ (cont'd)

- Upper limits for  $X \rightarrow HH$  cross section between 250–900 GeV for spin-0 and spin-2 assumption
- Compared to warped extra dimension models (bulk radion and graviton)

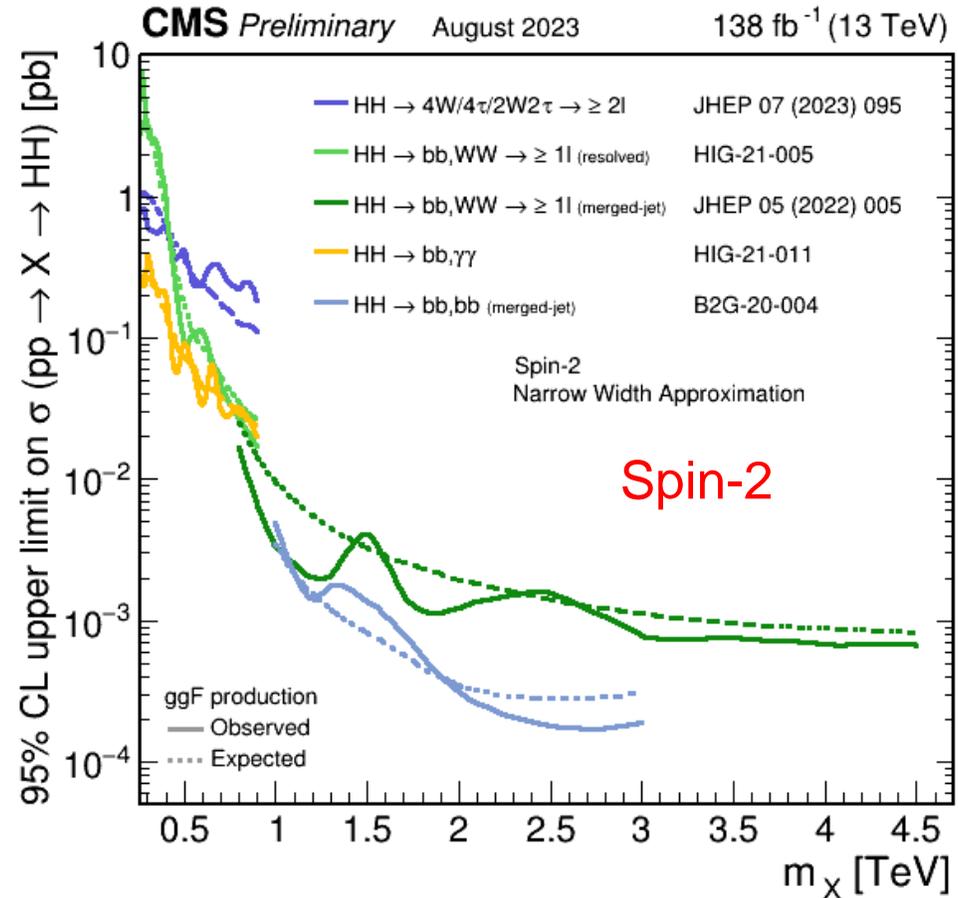

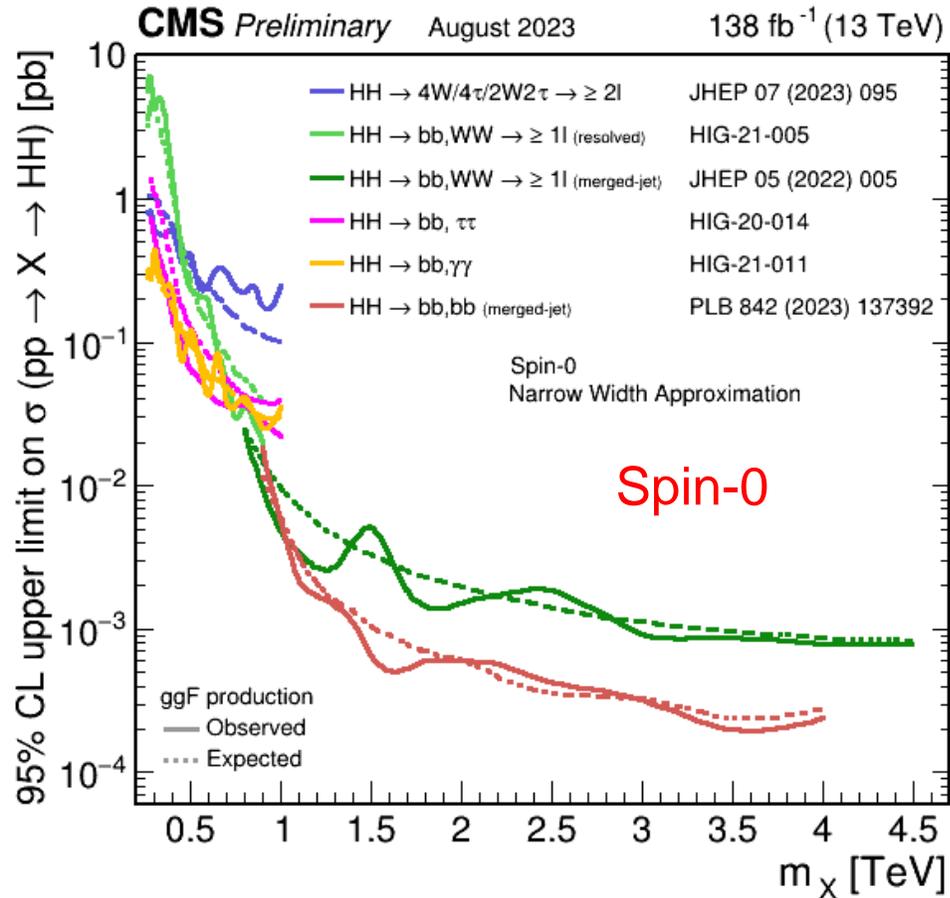

# Comparison of $X \rightarrow HH$ analyses

**NEW!**

<https://twiki.cern.ch/twiki/bin/view/CMSPublic/SummaryResultsHIG>

- Combination of many channels gives the **best sensitivity** to resonant Higgs production

# Search for $X \rightarrow SH \rightarrow VV \tau\tau$

## Extending to non-bb decay modes

arxiv:2307.11120

- Motivation: extended Higgs sectors (e.g. NMSSM) with additional neutral (pseudo-) scalars  $X$  and  $S$

- Signature:

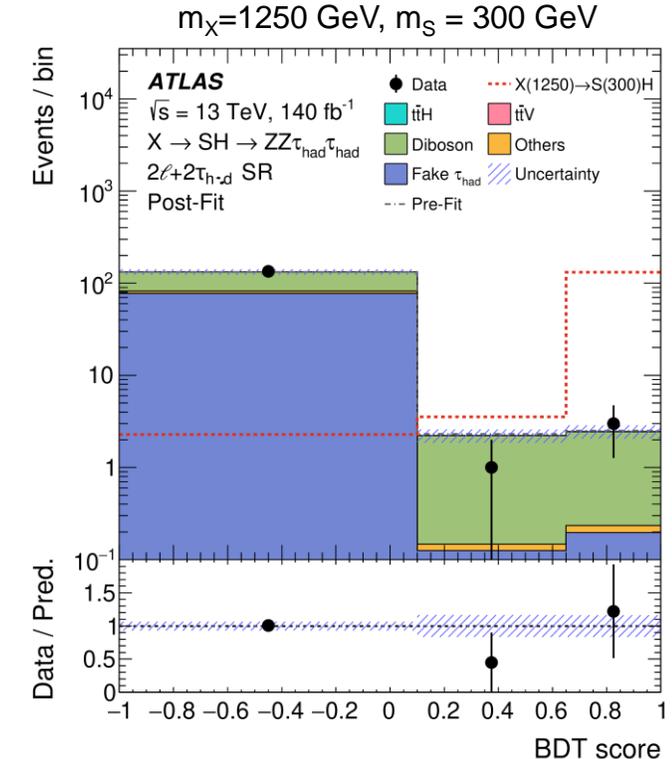

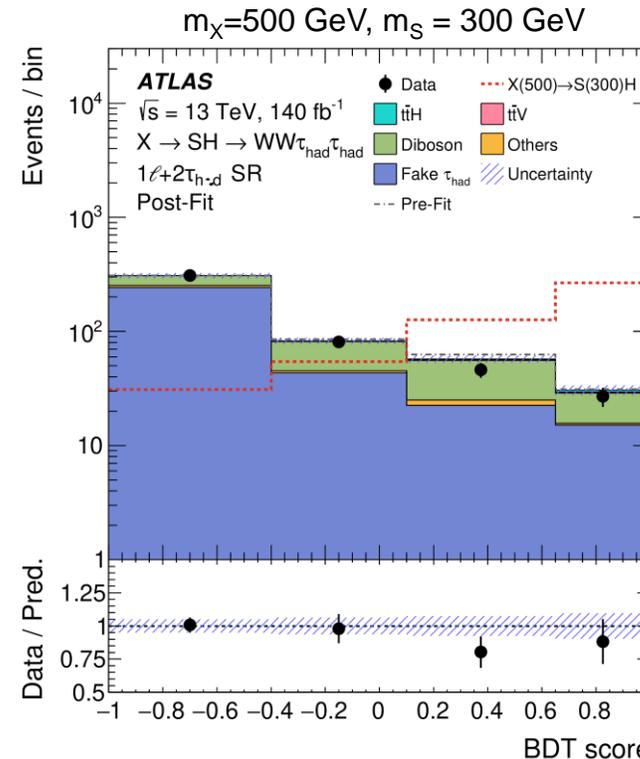

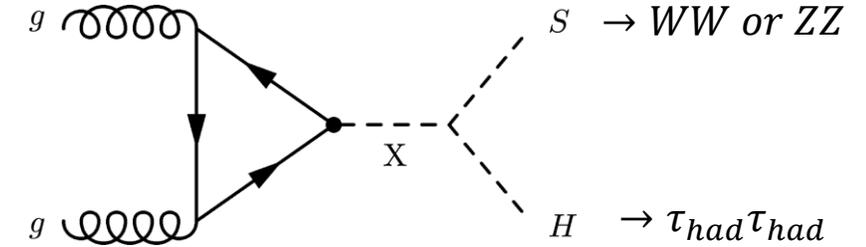

- $H \rightarrow \tau_{had}\tau_{had}$
- $S \rightarrow WW \text{ or } ZZ$ , with 1-2 leptons in final state

- Three signal regions:  $WW 1\ell 2\tau_{had}$ ,  
 $WW 2\ell 2\tau_{had}$ ,  $ZZ 2\ell 2\tau_{had}$

- BDTs to separate signal and background

- 12 BDTs parametric in  $m_X$  (one per signal region and  $S$  mass point)

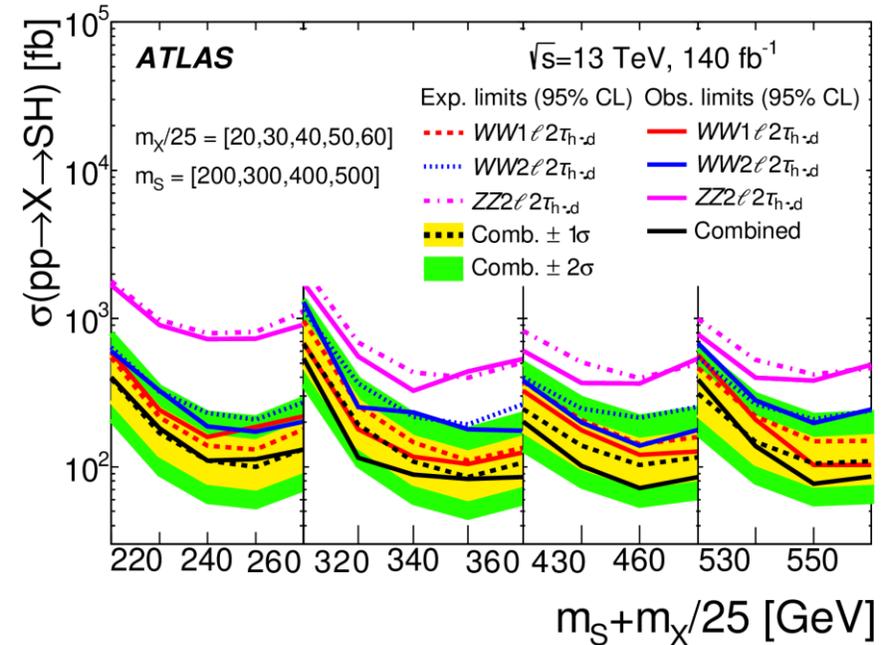

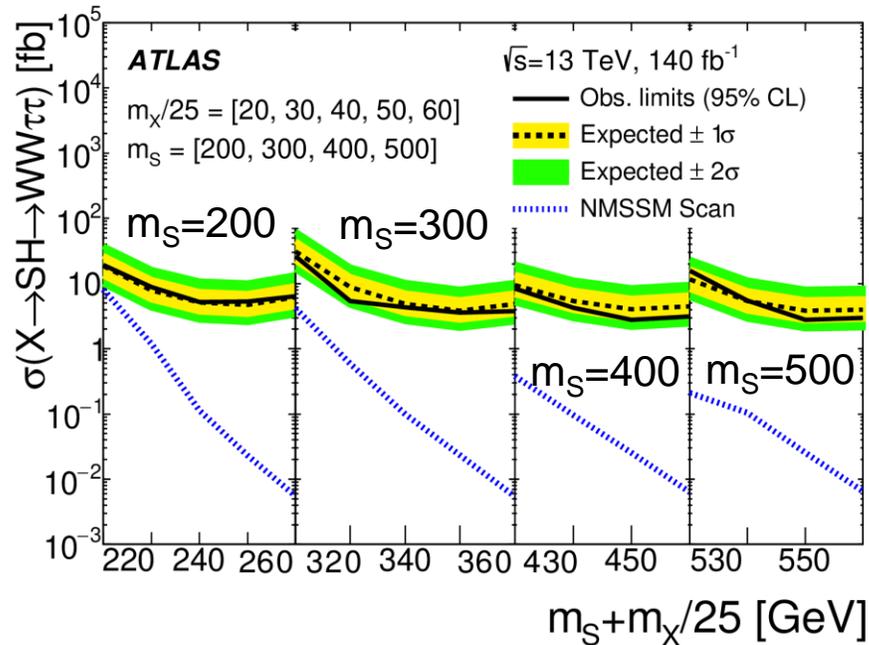

- Combined signal extraction from all BDT score distributions per  $(m_X, m_S)$  point

# Search for $X \rightarrow SH \rightarrow VV \tau\tau$ (cont'd)

arxiv:2307.11120

- $B(S \rightarrow VV)$  are not known. Assume values of SM H boson at this mass  $\rightarrow$  large
- Unrolled upper limits from  $(m_X, m_S)$  space

- $\rightarrow$  No significant excess seen at any mass combination. Most sensitive category:  $WW 1\ell 2\tau_{had}$
- $\rightarrow$  Approaching the **maximally allowed** NMSSM cross sections

# Search for low-mass Higgs bosons

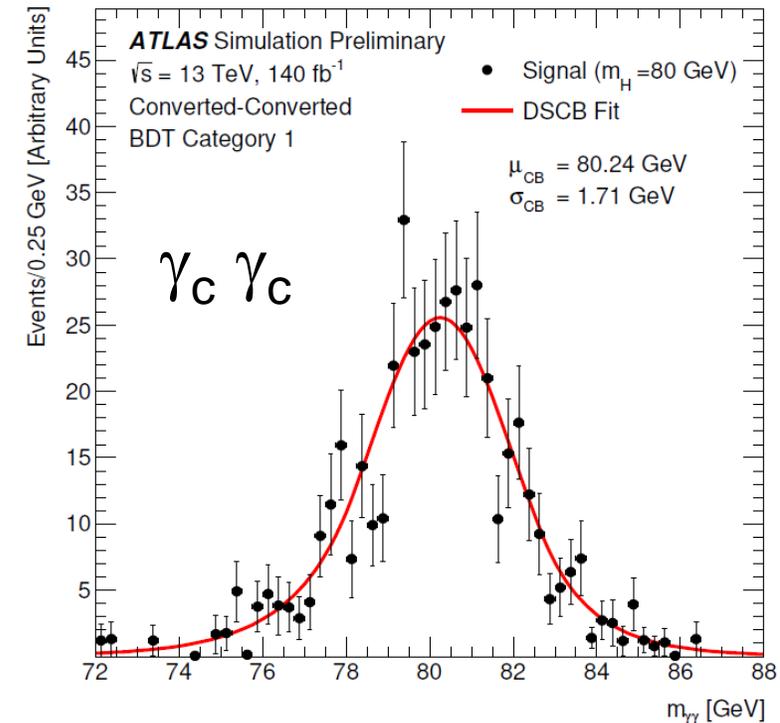

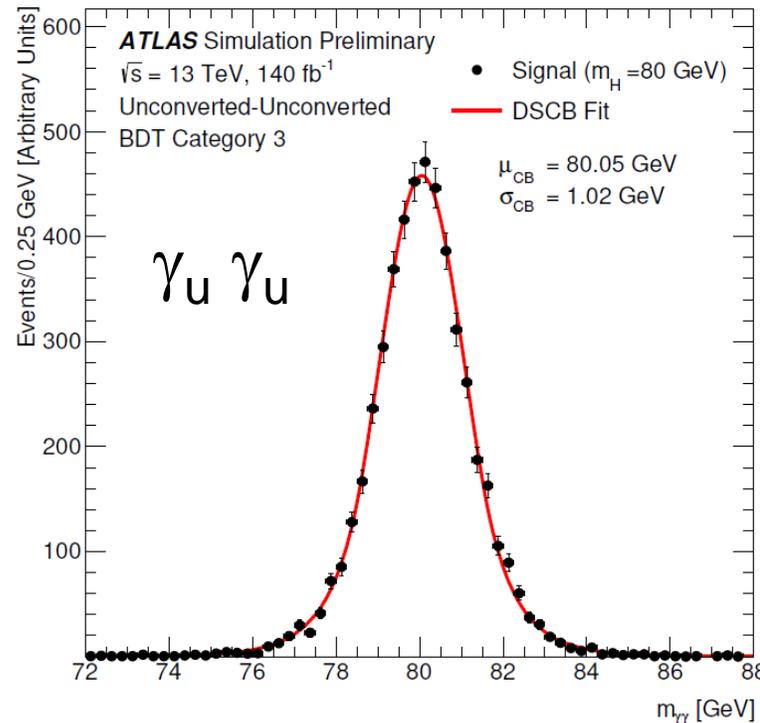

$H \rightarrow \gamma\gamma$

NEW!

ATLAS-CONF-2023-035

- Extended Higgs sectors might contain additional spin-0 bosons with  $m < 125$  GeV
  - could manifest themselves in the  $\gamma\gamma$  channel
- Due to the material between interaction point and electromagnetic calorimeter, a significant fraction of the photons convert to  $e^+e^-$  pairs
  - energy resolution
  - more difficult separation from electrons
- Important aspect:
  - background from **Drell-Yan** production ( $Z \rightarrow e^+e^-$  decays)

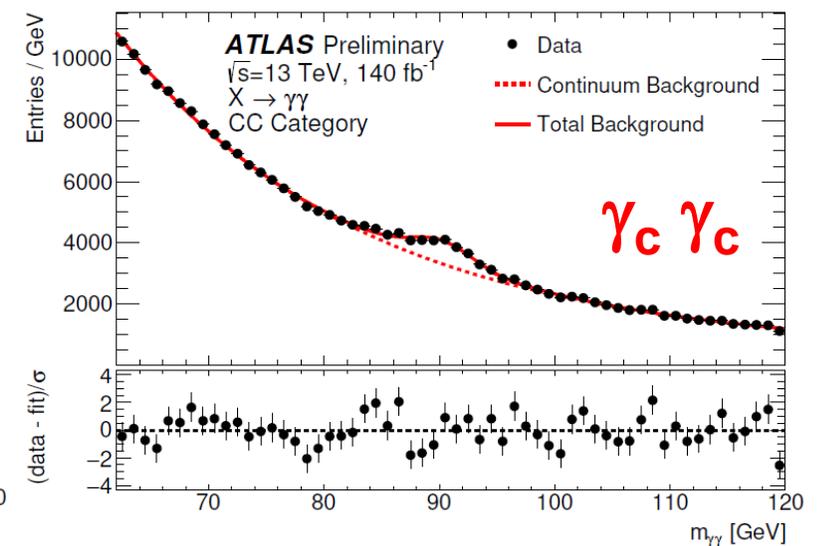

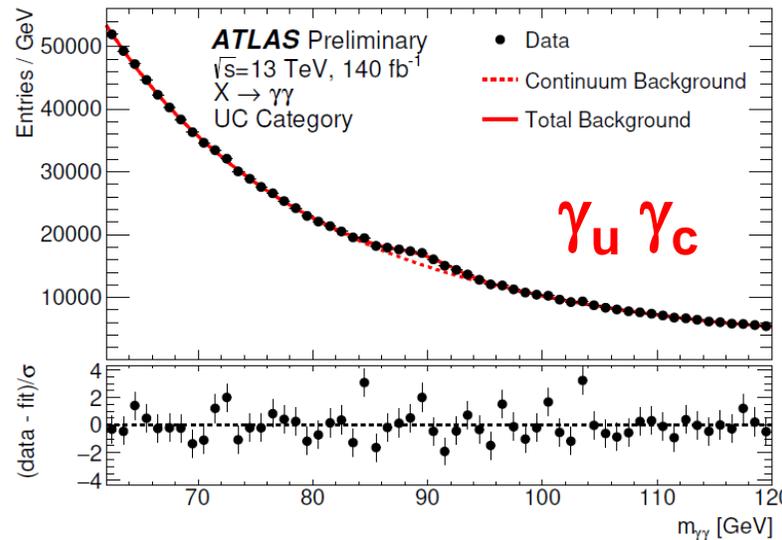

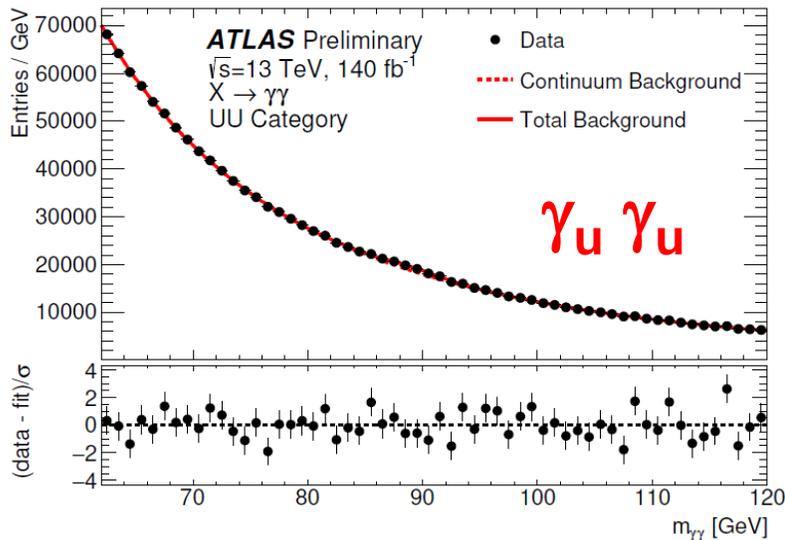

# Search for low-mass Higgs bosons (cont'd)

$H \rightarrow \gamma\gamma$

ATLAS-CONF-2023-035

- Three conversion categories:  $\gamma_u \gamma_u$ ,  $\gamma_u \gamma_c$ ,  $\gamma_c \gamma_c$
- Background modelling:
  - Non-resonant (continuum) background: shape and normalization determined from data
  - Resonant (Drell-Yan) background:  $Z \rightarrow ee$  events from data with corrections determined from simulation

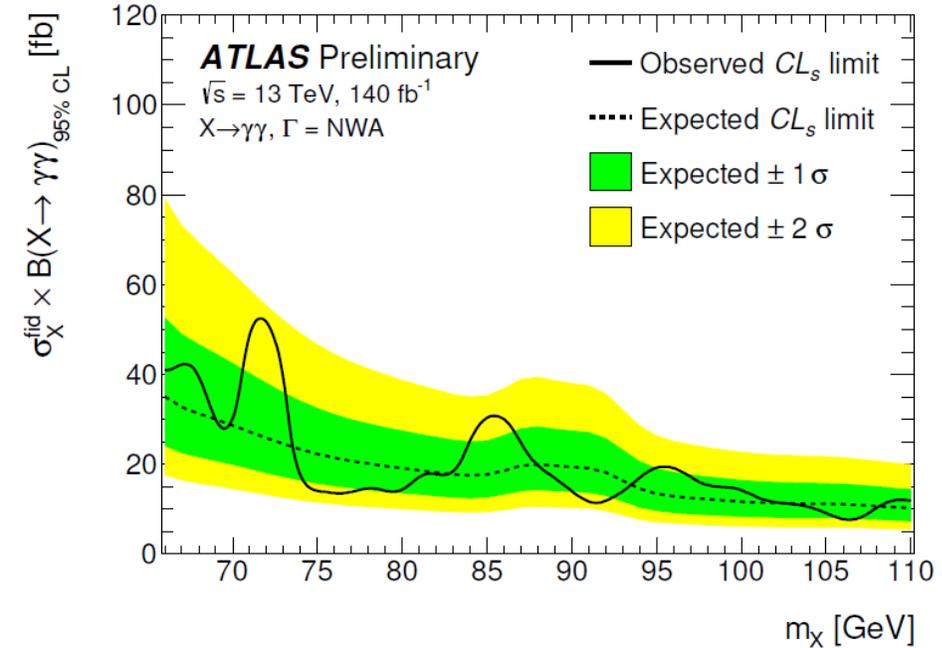

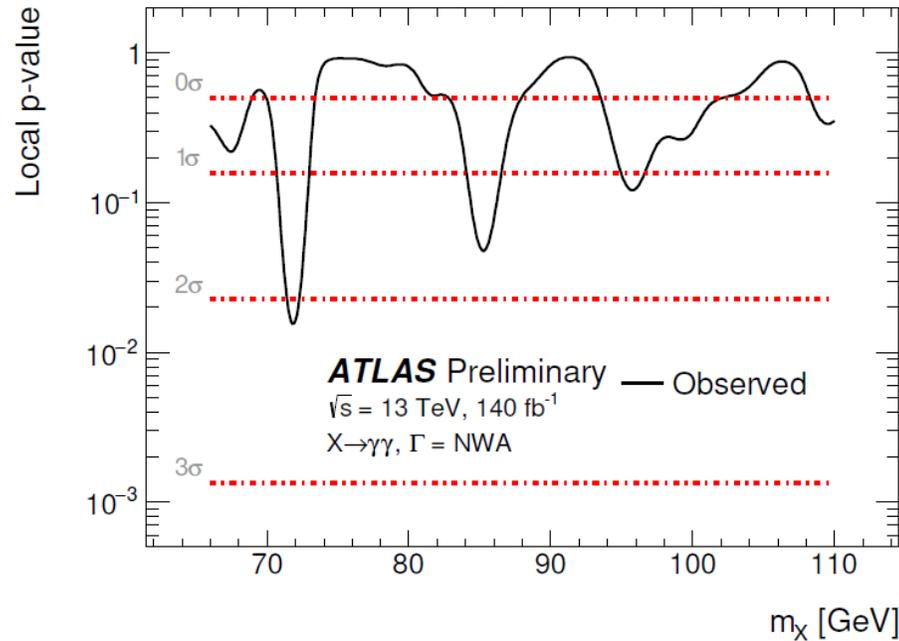

➔ Distributions are well described by SM background

# Search for low-mass Higgs bosons (cont'd)

$H \rightarrow \gamma\gamma$

ATLAS-CONF-2023-035

- ➔ No significant excess observed at any mass (model-independent search)
- A multivariate analysis trained with SM-like  $H \rightarrow \gamma\gamma$  gives more stringent, model-dependent limits (not shown)

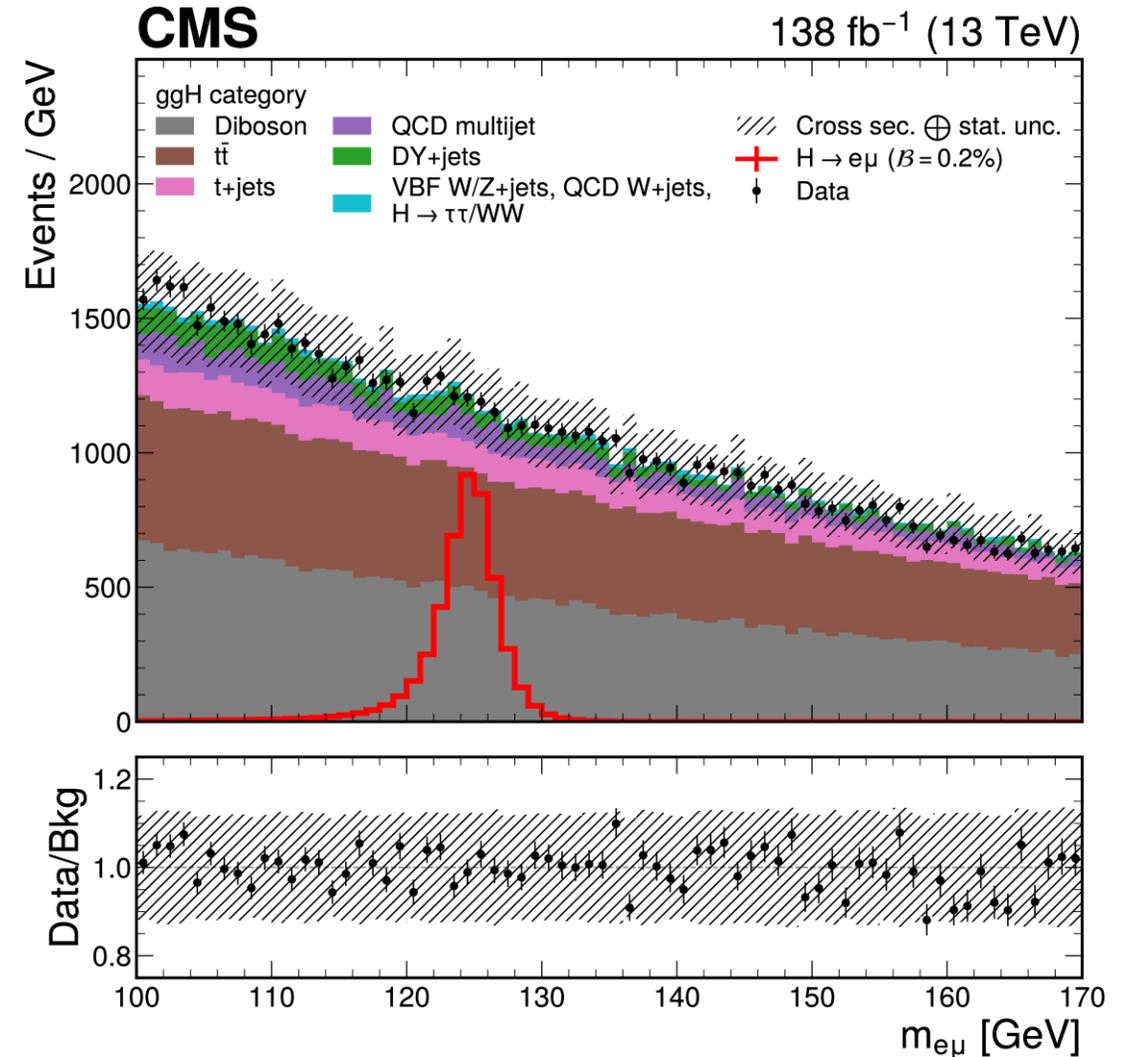

# Search for lepton-flavor violating H decays

$H \rightarrow e\mu$

arxiv:2305.18106

- In the SM, the H boson decays to lepton pairs of the same flavor
- In BSM models, e.g. in certain 2HDM variants, Yukawa couplings which do not conserve lepton-flavor are possible
  - flavor-violating decays of H boson at 125 GeV
  - new bosons at other masses appearing in such final states
- Here: search for  $H \rightarrow e\mu$  in gluon-fusion and VBF
- Choose mass window beyond the peak from  $t\bar{t}$  production  $\rightarrow$  smoothly falling background
- Categorization with signal/background discriminating BDT  $\rightarrow$  in total 6 categories

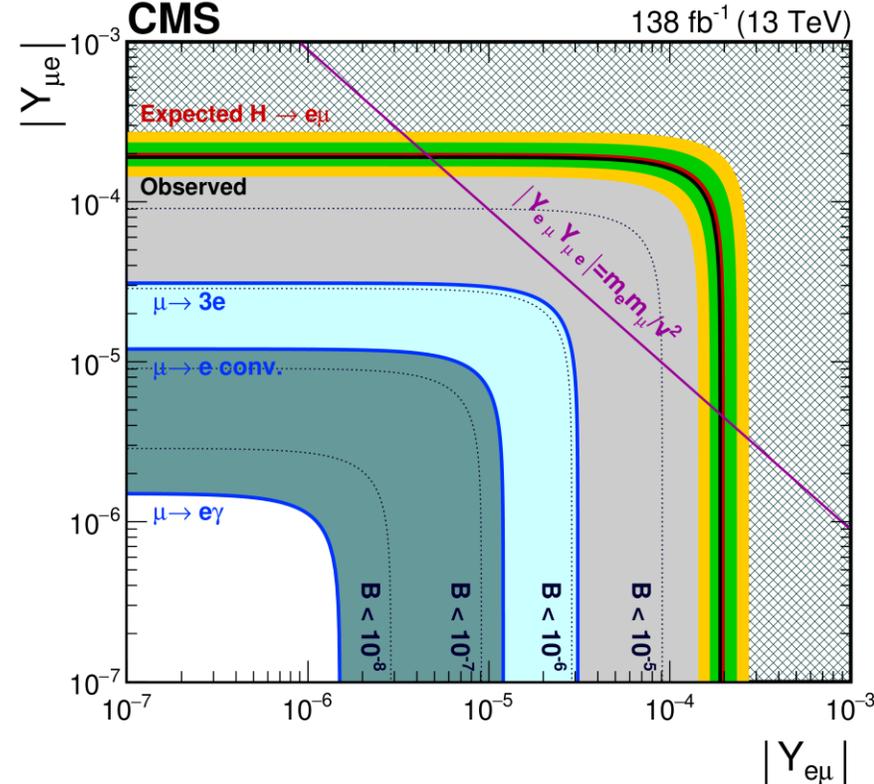

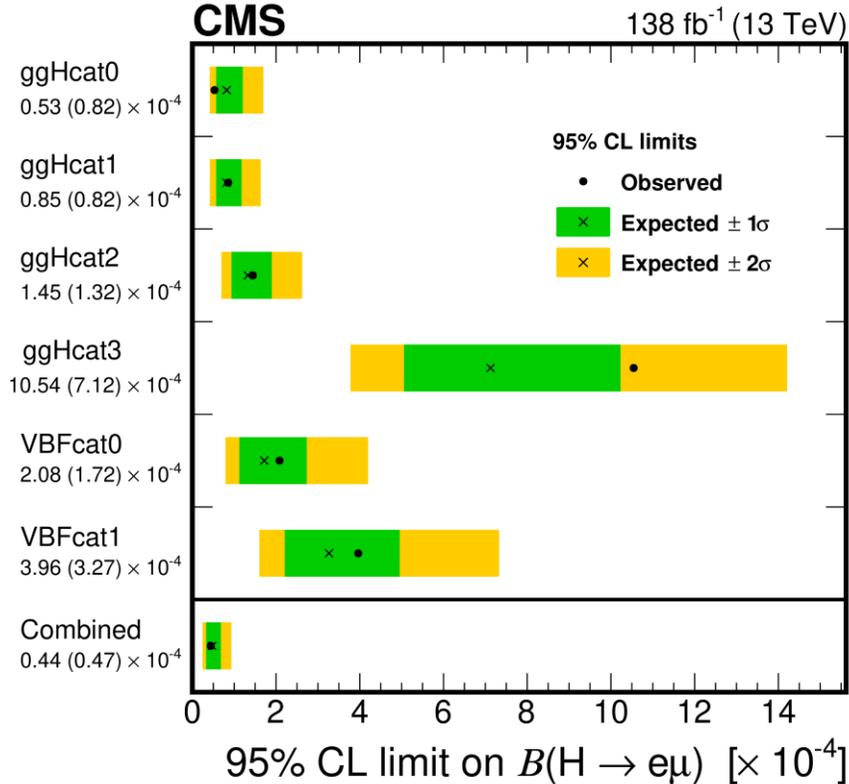

# Search for lepton-flavor violating H decays (cont'd)

$H \rightarrow e\mu$

arxiv:2305.18106

→ No excess observed for  $H \rightarrow e\mu$  at  $m=125$  GeV

→  $B(H \rightarrow e\mu) < 4.4$  (4.7)  $\cdot 10^{-5}$  obs.(exp.) at 95% CL → **most stringent direct limit** so far

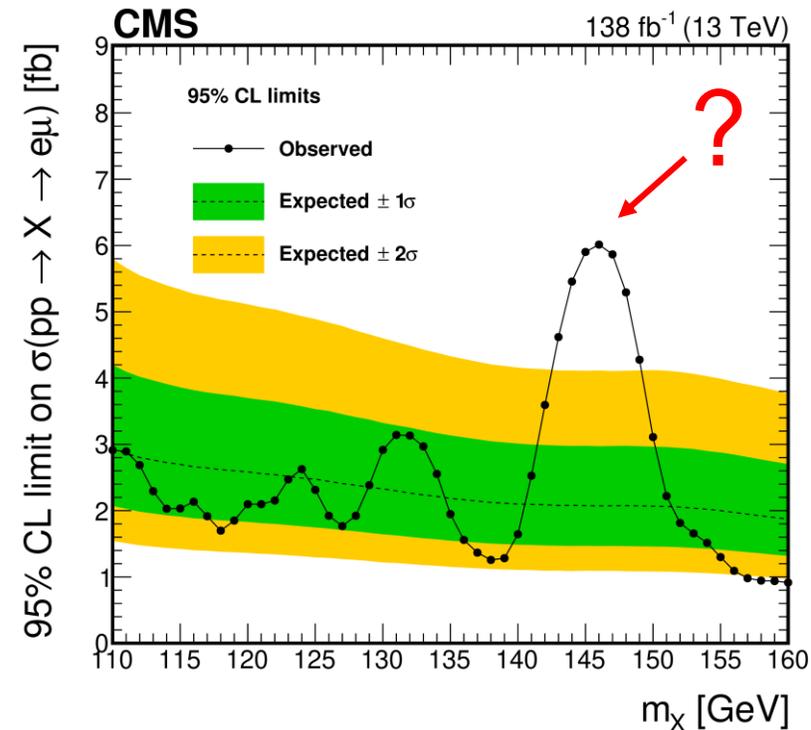

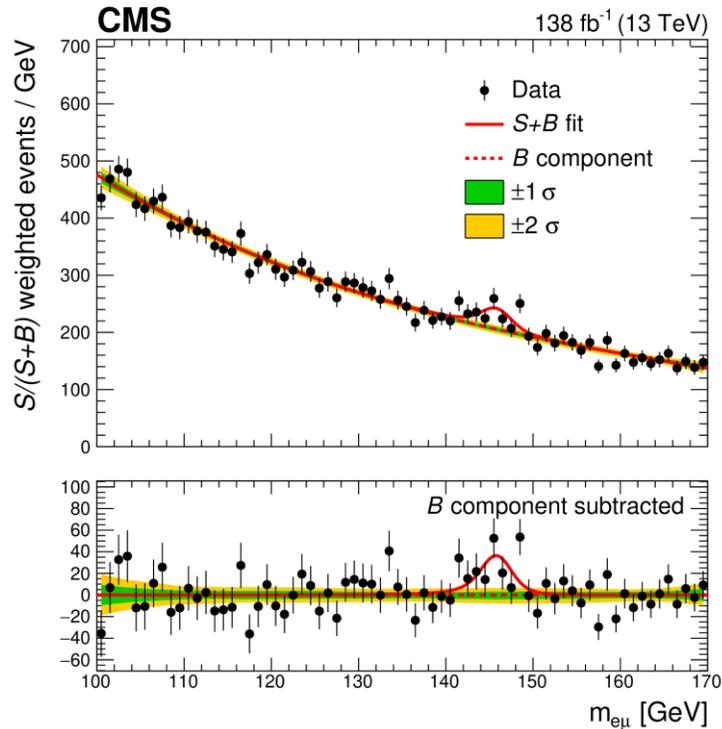

for recent results on  $H \rightarrow e\tau$  and  $H \rightarrow \mu\tau$  from ATLAS, see arXiv:2302.05225, JHEP 07 (2023) 166

# Search for lepton-flavor violating H decays (cont'd)

$H \rightarrow e\mu$

arxiv:2305.18106

- At a larger mass of  $\sim 146$  GeV, a mild excess is seen
  - significance  $3.8 \sigma$  local ( $2.8 \sigma$  global) → might be a fluctuation, need more data to conclude
  - **first result** of a direct  $X \rightarrow e\mu$  search with  $M_X < 2m_W$

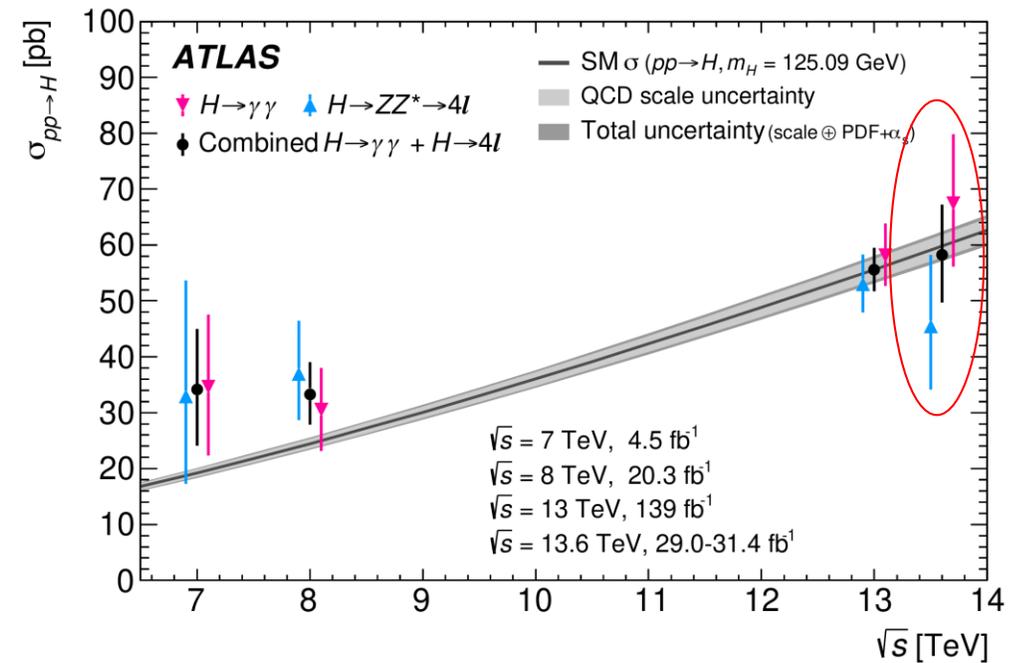

- Properties of H boson measured with unparalleled precision by ATLAS + CMS
  - Crucial recent updates on key questions in the Higgs sector
  - Currently all property measurements are a formidable confirmation of electroweak symmetry breaking as predicted in the SM
- Widely cast net searching for signatures of BSM physics involving Higgs bosons
  - Approaching the ultimate precision from Run 2
  - Some mild excesses observed whose nature needs to be clarified with further data and additional analyses

# Outlook

- More Run 2 results still to come
- Run 3 will strongly increase the impact in Higgs boson physics
  - first measurements already done
  - further accumulation of integrated luminosity to surpass Run 2 precision
- Beyond Run 3, HL-LHC will paint the ultimate picture of the Higgs boson

arxiv:2306.11379

H in Run 3

# Backup

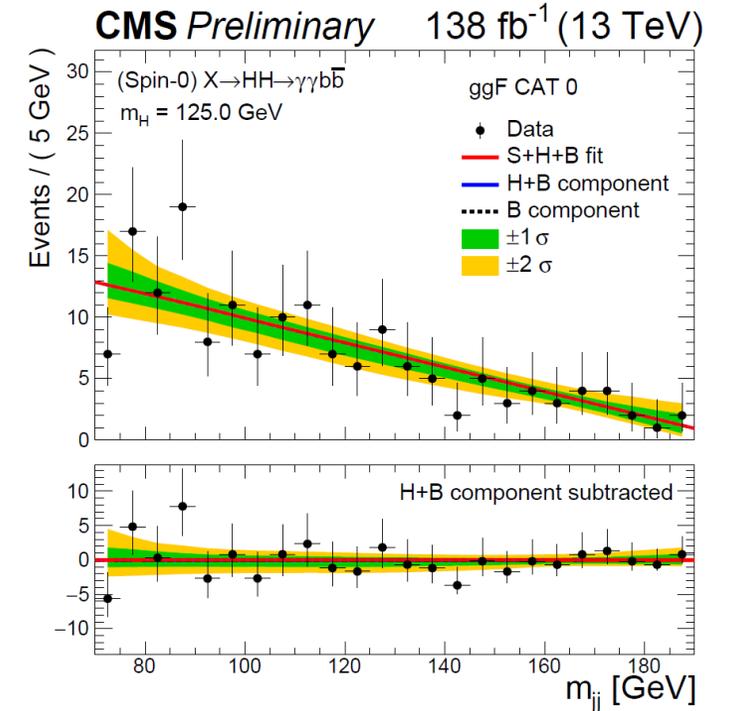

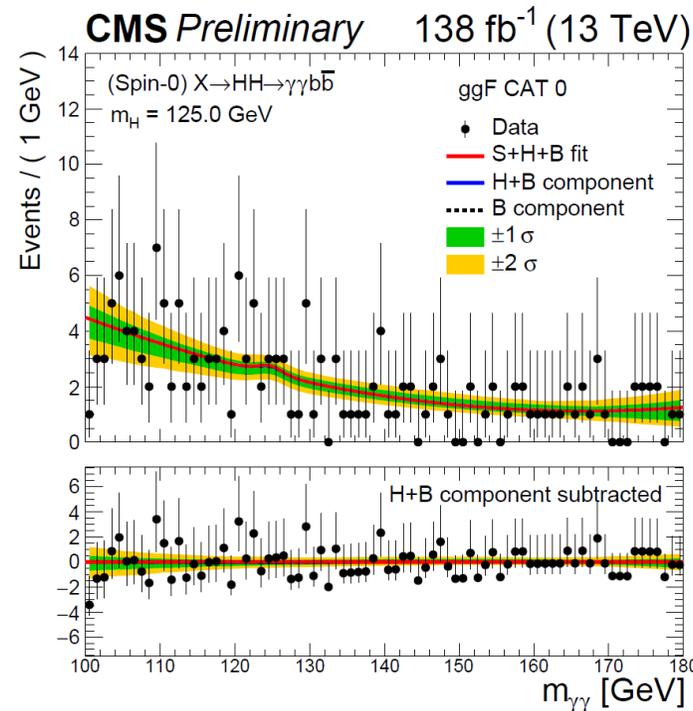

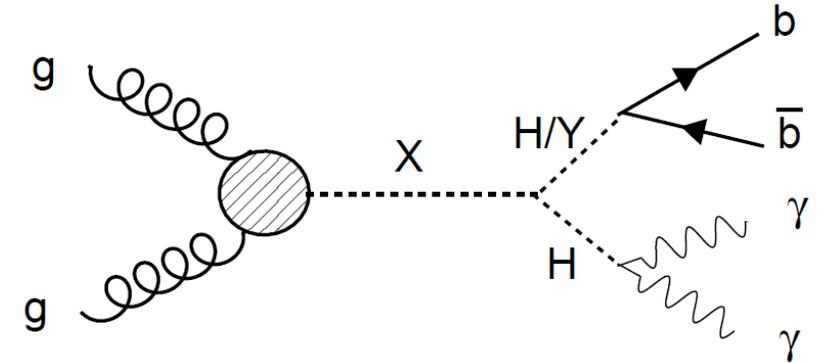

# Search for $X \rightarrow YH \rightarrow bb \gamma\gamma$

## Resonant production of Higgs bosons

- Motivation: extended Higgs sectors (e.g. NMSSM) with additional neutral (pseudo-)scalars  $X$  and  $Y$ 
  - warped extra dimensions in case of  $Y=H$
- A growing experimental field... many channels still uncovered

- Reconstruct  $m_{\gamma\gamma bb}$  taking nominal values of  $m_H$  and  $m_Y$  into account
- Signal extraction in 2D space of  $(m_{\gamma\gamma}, m_{jj})$  after  $M_X$  selection

CMS PAS HIG-21-011

for  $m_X = 400$  GeV

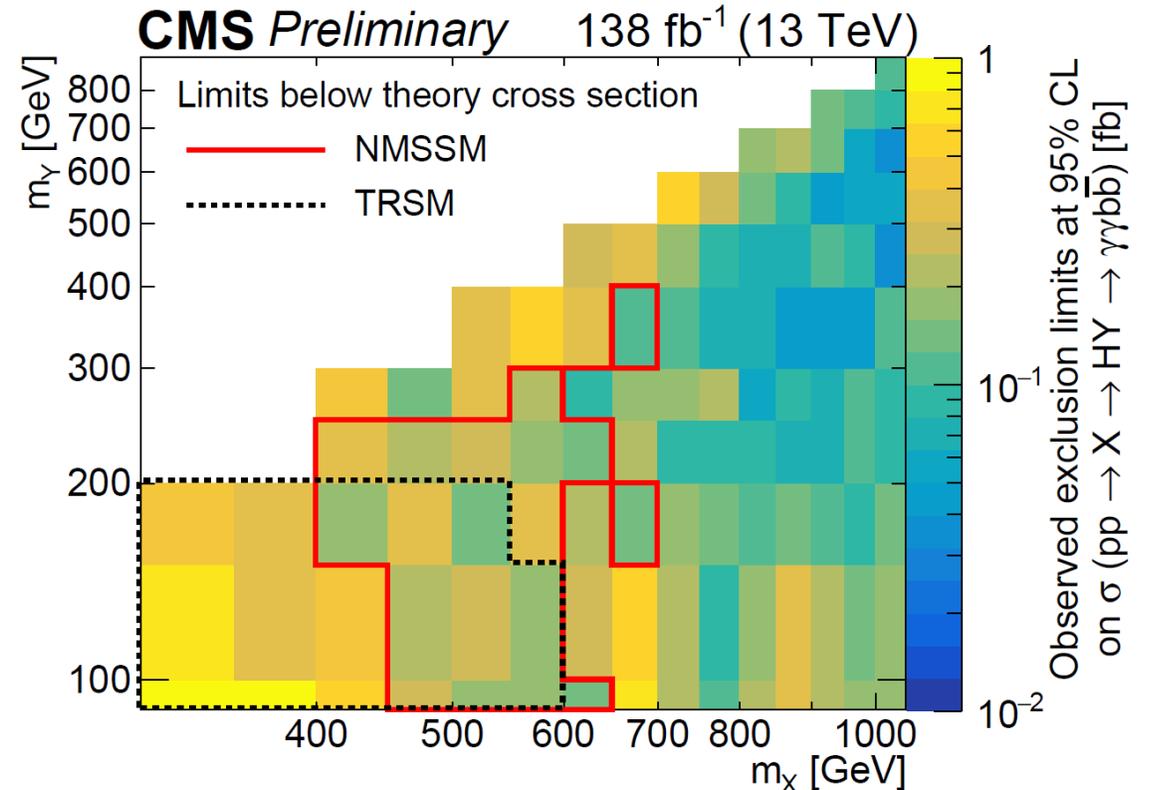

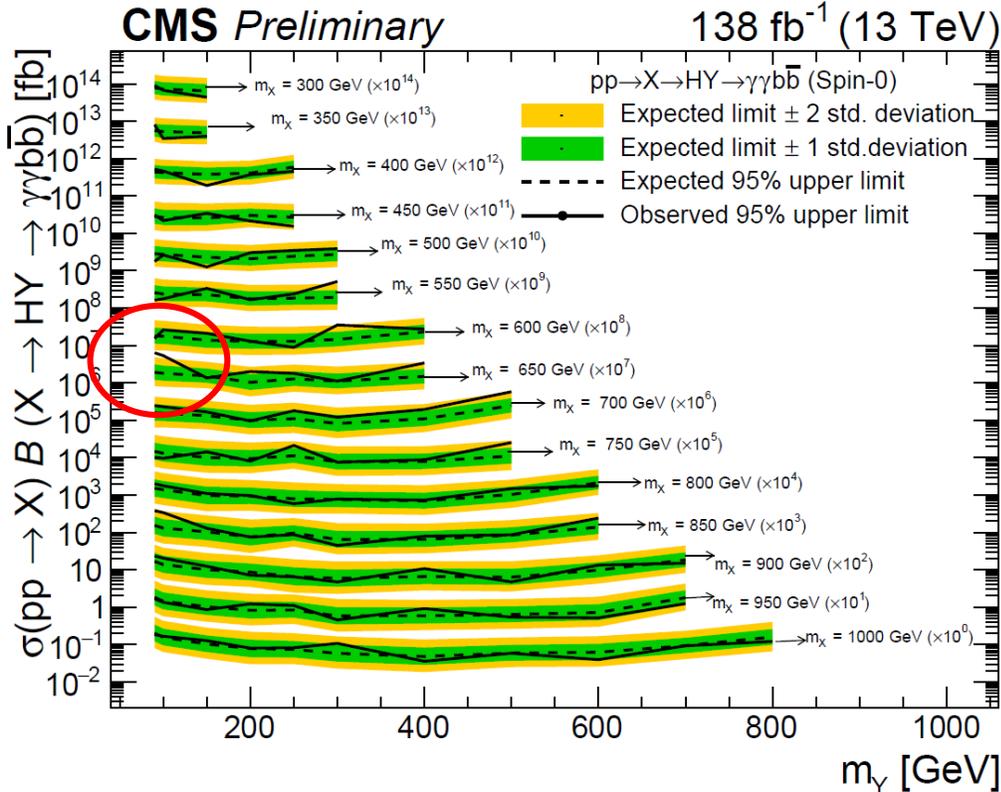

# Search for $X \rightarrow YH \rightarrow bb \gamma\gamma$ (cont'd)

## Resonant production of Higgs bosons

CMS PAS HIG-21-011

- Mild deviation from background-only hypothesis with local (global) significance of  $3.8 \sigma$  ( $2.8 \sigma$ ) for  $m_X = 650$  GeV and  $m_Y = 90$  GeV.
- Exclusions in parameter space of NMSSM and TRSM models

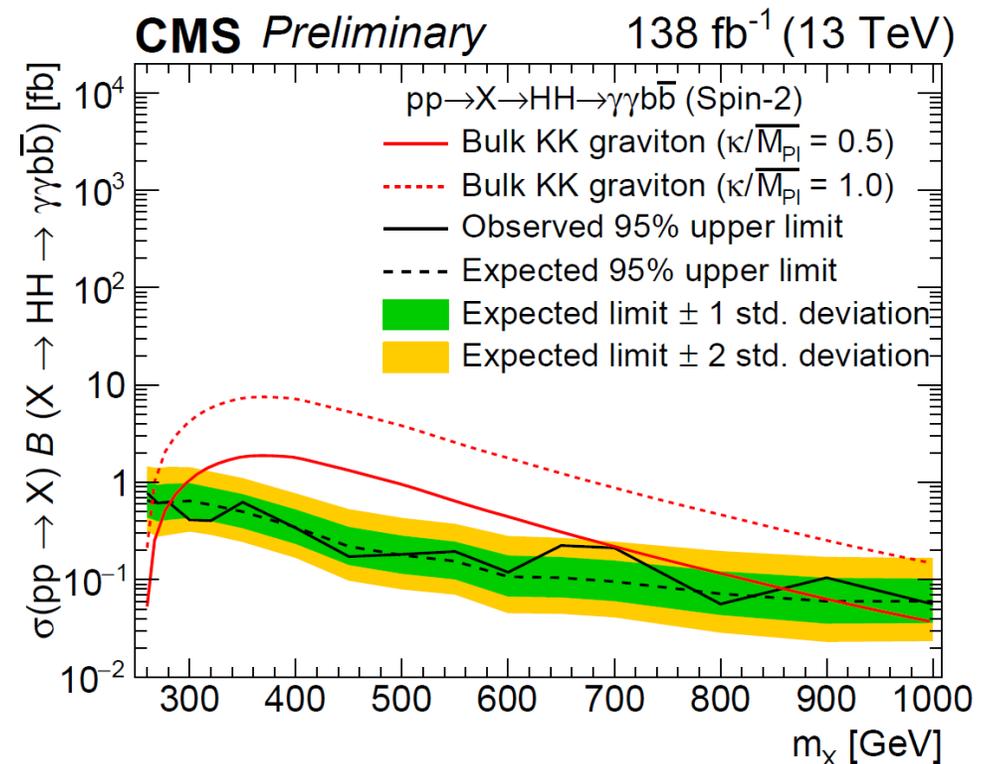

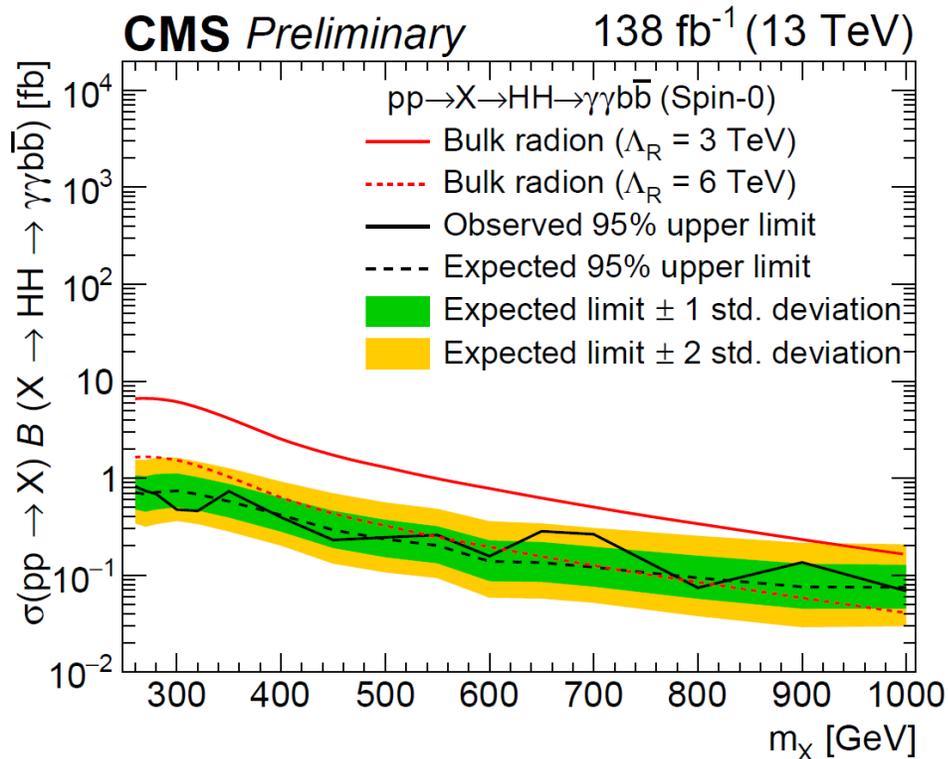

# Resonant production of Higgs bosons (cont'd)

Symmetric case:  $X \rightarrow HH$  decays

CMS PAS HIG-21-011

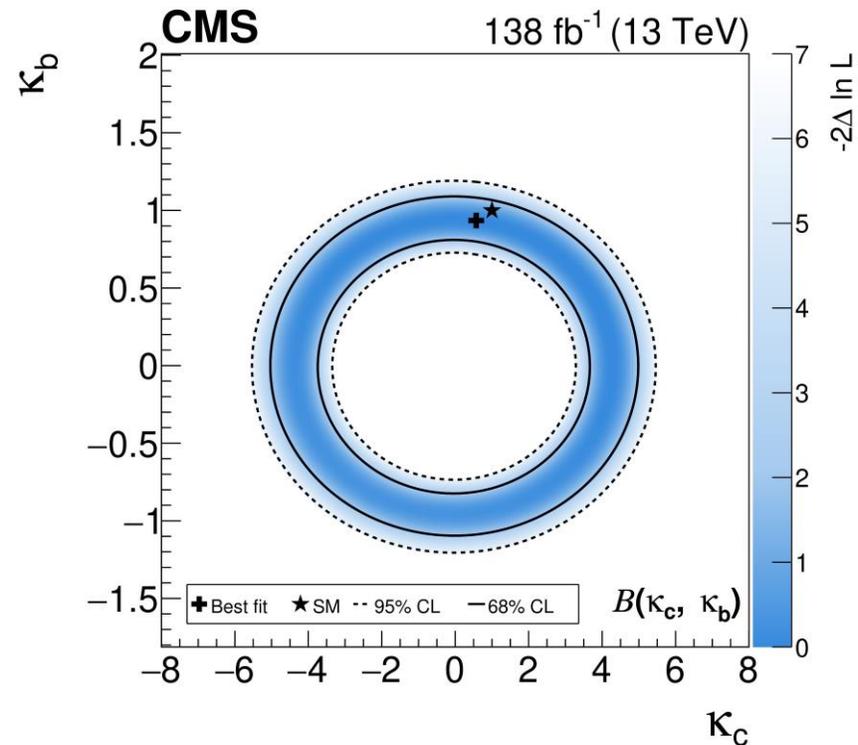

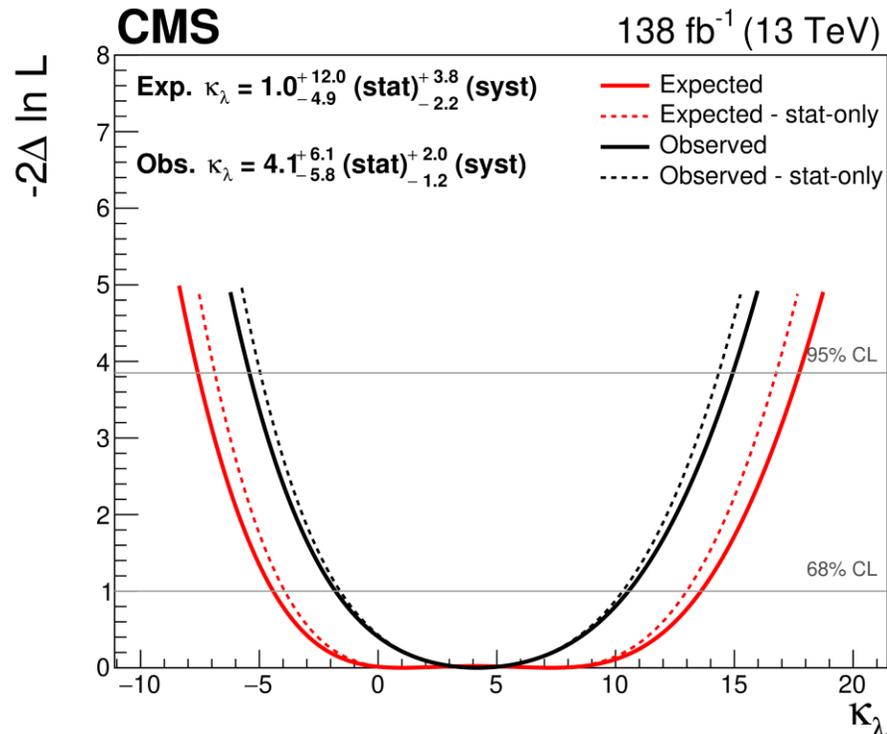

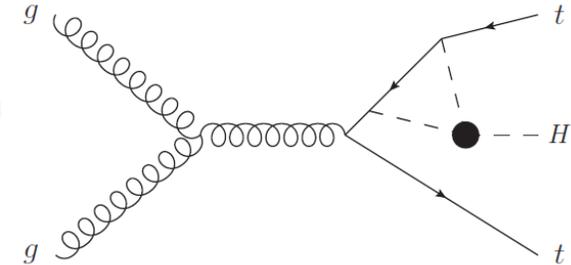

- In the symmetric case ( $Y=H$ ), strong exclusion limits in particular in the low  $m_X$  regime
- Bulk radion (spin 0) and Kaluza Klein graviton (spin 2) excluded for specific parameters

# Differential cross sections in $H \rightarrow 4\ell$ (cont'd)

- Even possible to constrain the trilinear Higgs coupling from the  $p_T$  distributions
  - NLO corrections depending on  $\kappa_\lambda$  in  $t\bar{t}H$  and  $VH$  modes  $\rightarrow$  to be compared with results from  $HH$  production
- Gluon fusion process proceeds via quark loop  $\rightarrow$  sensitive to H-c Yukawa coupling

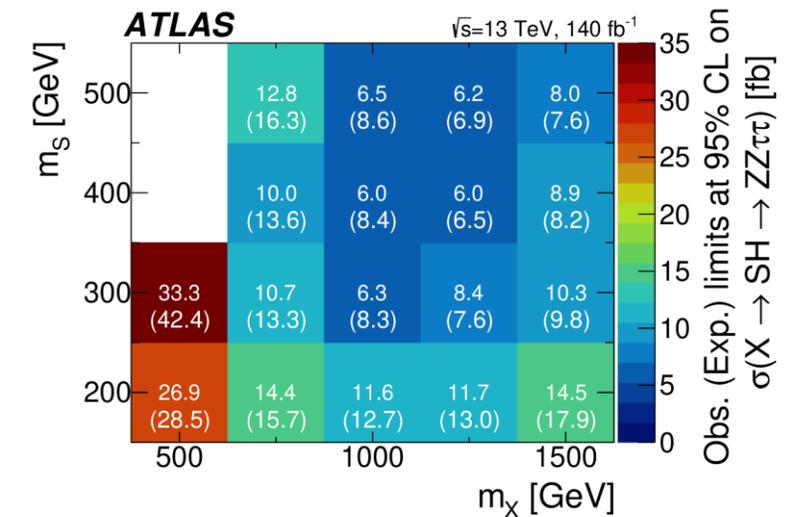

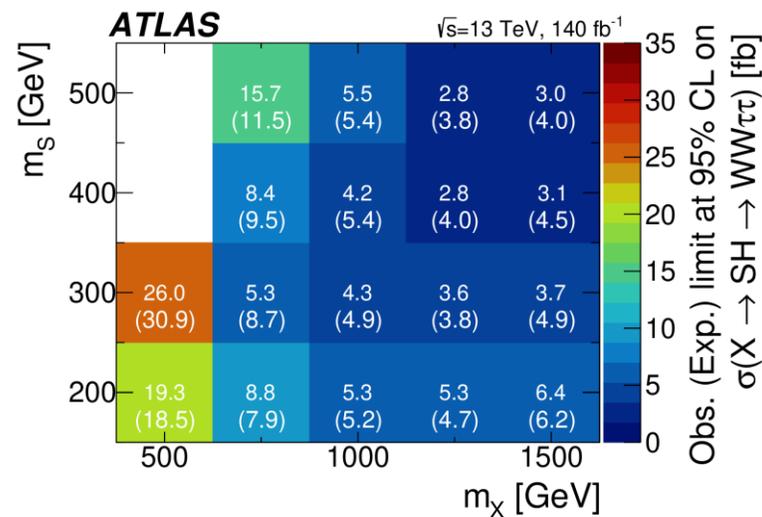

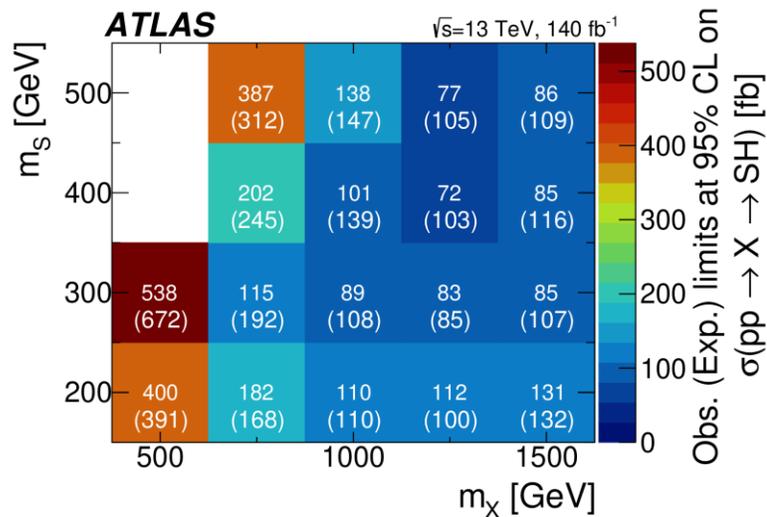

# Resonant production of Higgs bosons (cont'd)

## Search for $X \rightarrow SH$ decays

arxiv:2307.11120

- No significant excess seen at any mass combination
- $B(S \rightarrow VV)$  are not known. Assume values of SM H boson at this mass  $\rightarrow$  large  $B(\rightarrow VV)$

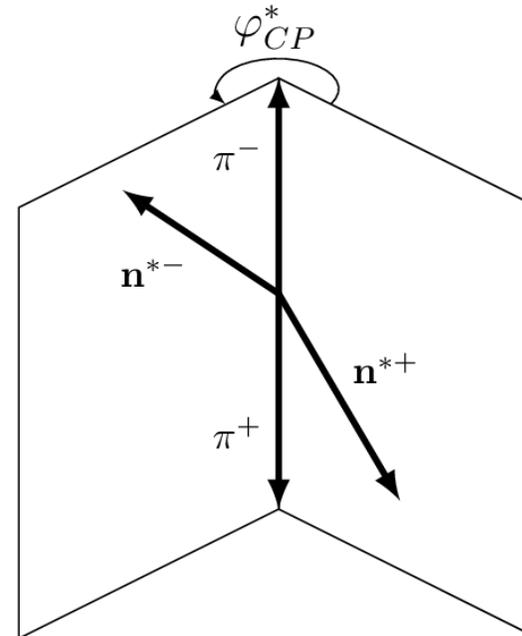

# CP properties of $H\tau$ Yukawa interaction

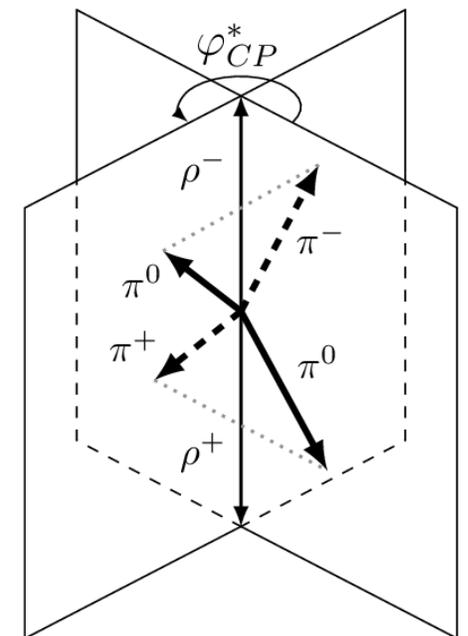

- SM H boson has  $CP=+1 \rightarrow$  confirmed by experiment, but some  $CP= -1$  admixture not excluded
- Can be tested through CP structure of Yukawa interaction
  - quantified by mixing angle  $\phi_\tau$ , where  $\phi_\tau=0$  corresponds to the SM (pure  $CP=+1$ )
  - encoded in spin correlations in  $H \rightarrow \tau\tau$  decays
- CP-sensitive variable: angle between the decay planes of the two  $\tau$  leptons,  $\phi_{CP}^*$
- Analysis focuses on 1- and 3-prong decays

Notation	Decay mode	Branching fraction
$\ell$	$\ell^\pm \bar{\nu} \nu$	35.2%
1p0n	$h^\pm \nu (\pi^\pm \nu)$	11.5% (10.8%)
1p1n	$h^\pm \pi^0 \nu (\pi^\pm \pi^0 \nu)$	25.9% (25.5%)
1pXn	$h^\pm \geq 2\pi^0 \nu (\pi^\pm 2\pi^0 \nu)$	10.8% (9.3%)
3p0n	$3h^\pm \nu (3\pi^\pm \nu)$	9.8% (9.0%)

$(\tau \rightarrow \pi \nu)$   
 $(\tau \rightarrow \rho \nu)$   
 $(\tau \rightarrow a_1 \nu)$

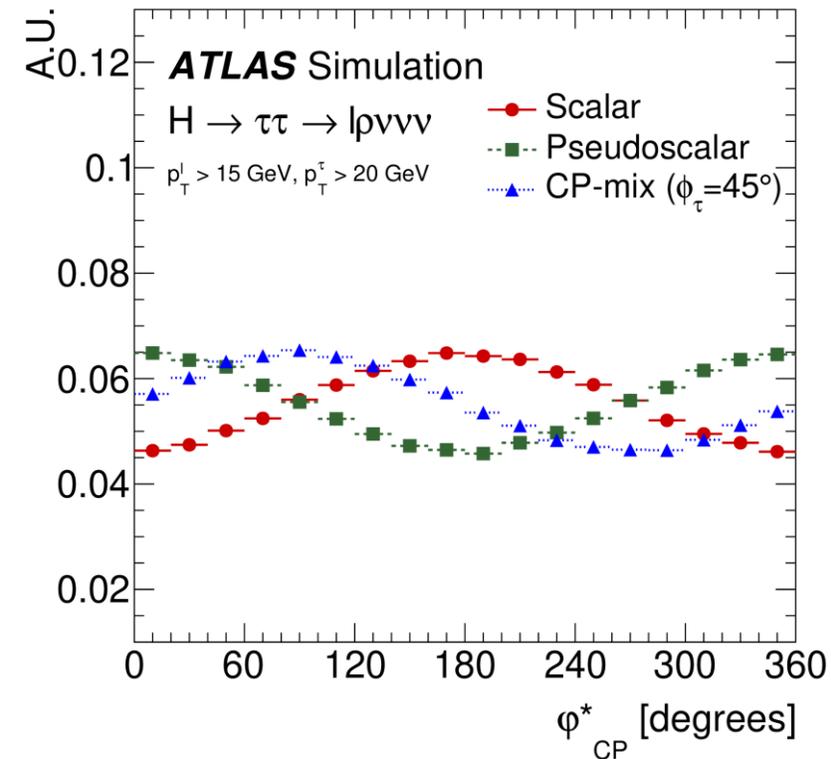

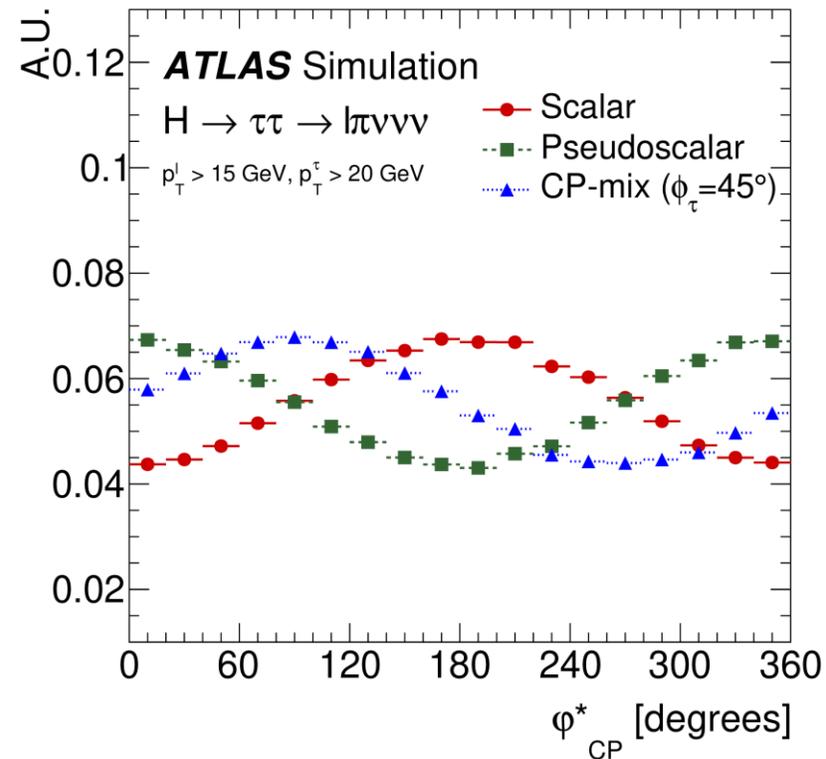

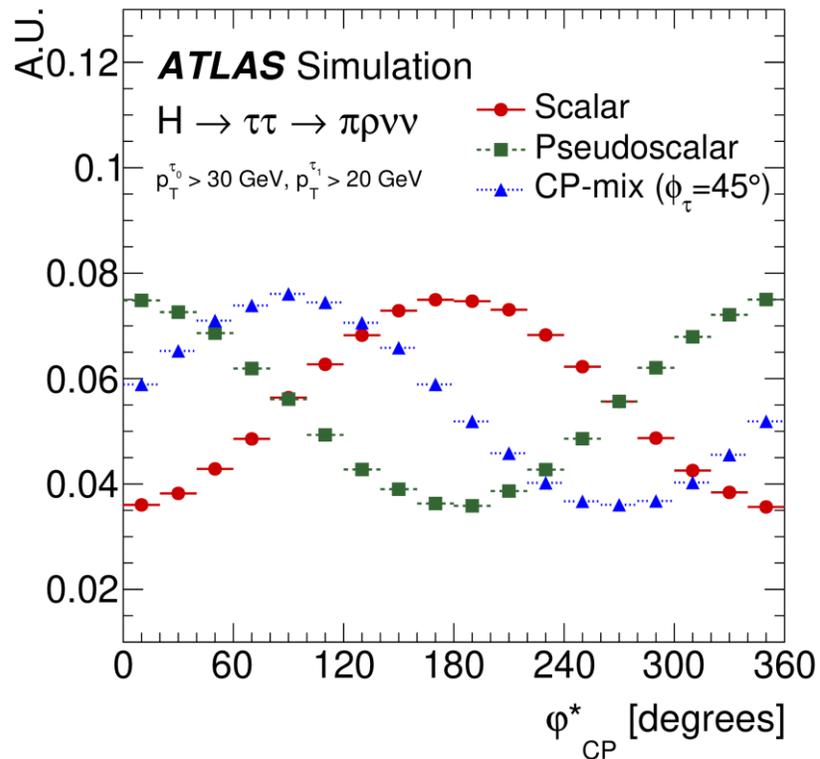

impact parameter method

$\rho$  decay plane method

# CP properties of $H\tau$ Yukawa interaction (cont'd)

- Signature tested on simulation (before detector effects)
- Variation of mixing angle  $\phi_\tau$  results in a phase shift of modulation in  $\varphi_{CP}^*$  distribution
- Strength of effect varies depending on decay channel combination

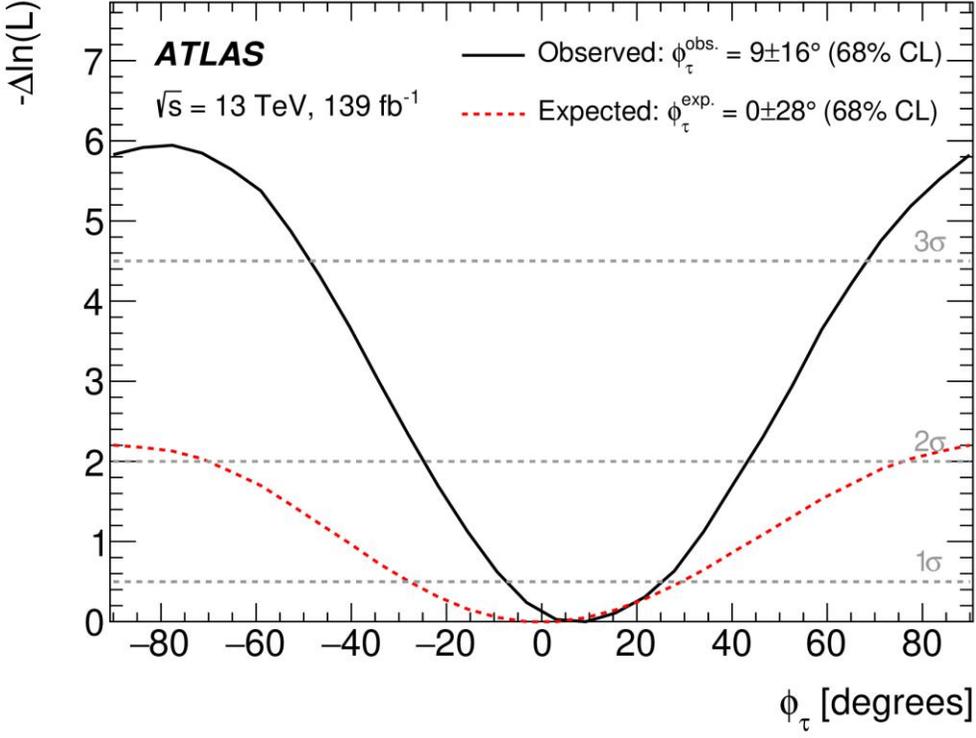

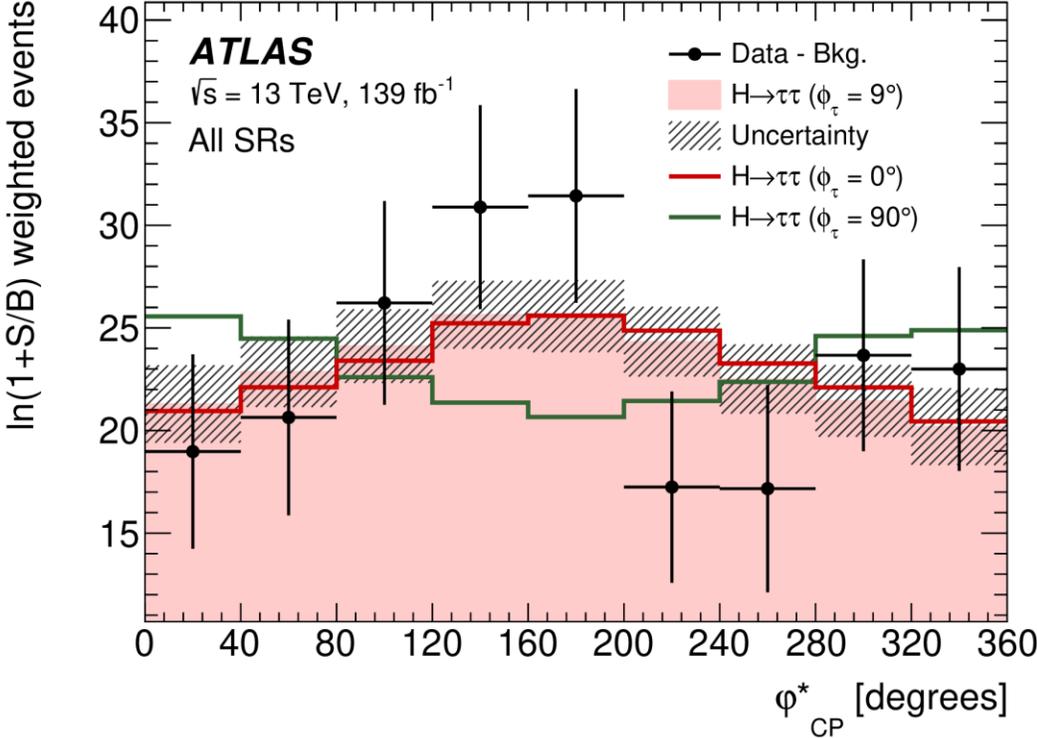

# CP properties of $H\tau$ Yukawa interaction (cont'd)

Eur. Phys. J. C 83 (2023) 563

- Combination of all data gives  $\phi_\tau = 9^\circ \pm 16^\circ$  obs. ( $0^\circ \pm 28^\circ$  exp.)
- The pure CP-odd hypothesis is excluded at a level of  $3.4\sigma$

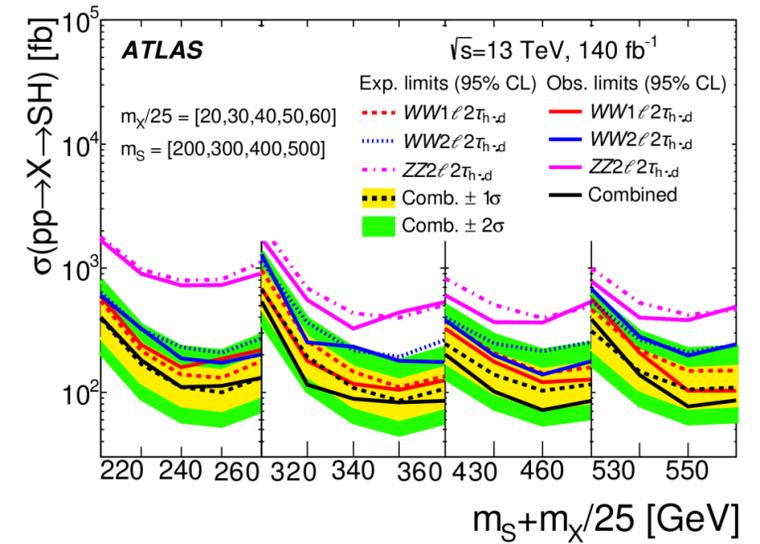

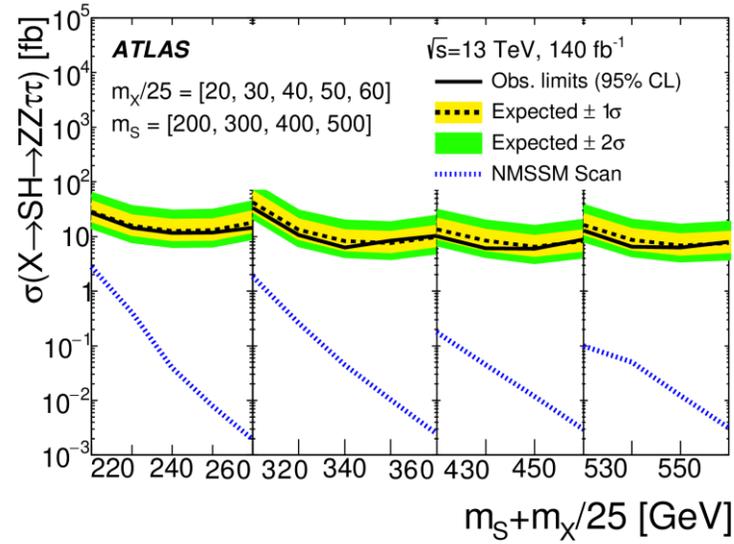

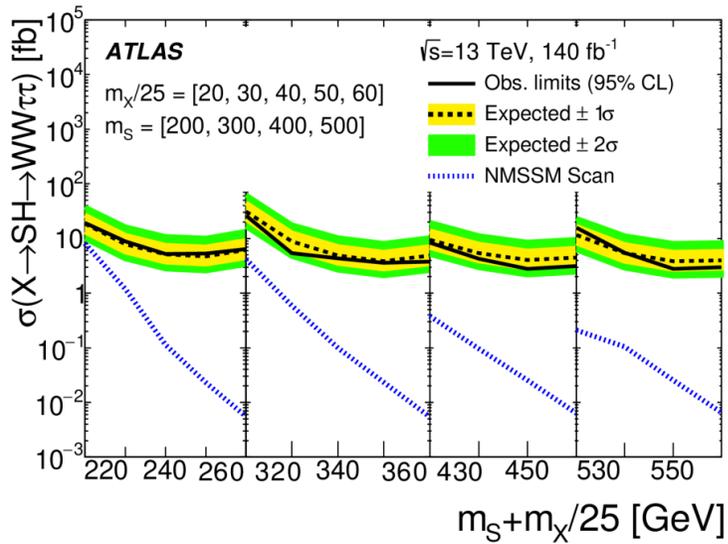

# Resonant production of Higgs bosons (cont'd)

arxiv:2307.11120

## Search for $X \rightarrow SH$ decays

for  $m_X = 400$  GeV

# Measurement of Higgs boson mass: $H \rightarrow ZZ^* \rightarrow 4 \ell$

$\ell = e, \mu$

- Various improvements: increased dataset, improved muon momentum scale calibration
- Neural-network based classifier for S/B discrimination
- Full Run 2 result:  $m_H = 124.99 \pm 0.18$  (stat.)  $\pm 0.04$  (syst.) GeV =  $124.99 \pm 0.19$  GeV
- Run 1 + Run 2:  $m_H = 124.94 \pm 0.17$  (stat.)  $\pm 0.03$  (syst.) GeV =  $124.94 \pm 0.18$  GeV
